

# A LOW-COST LORA GATEWAY WITH QoS FEATURES

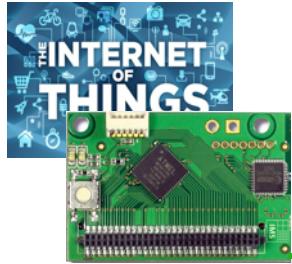

C. PHAM (UNIV. PAU, FRANCE)

LAST UPDATE: 23RD MAY, 2016

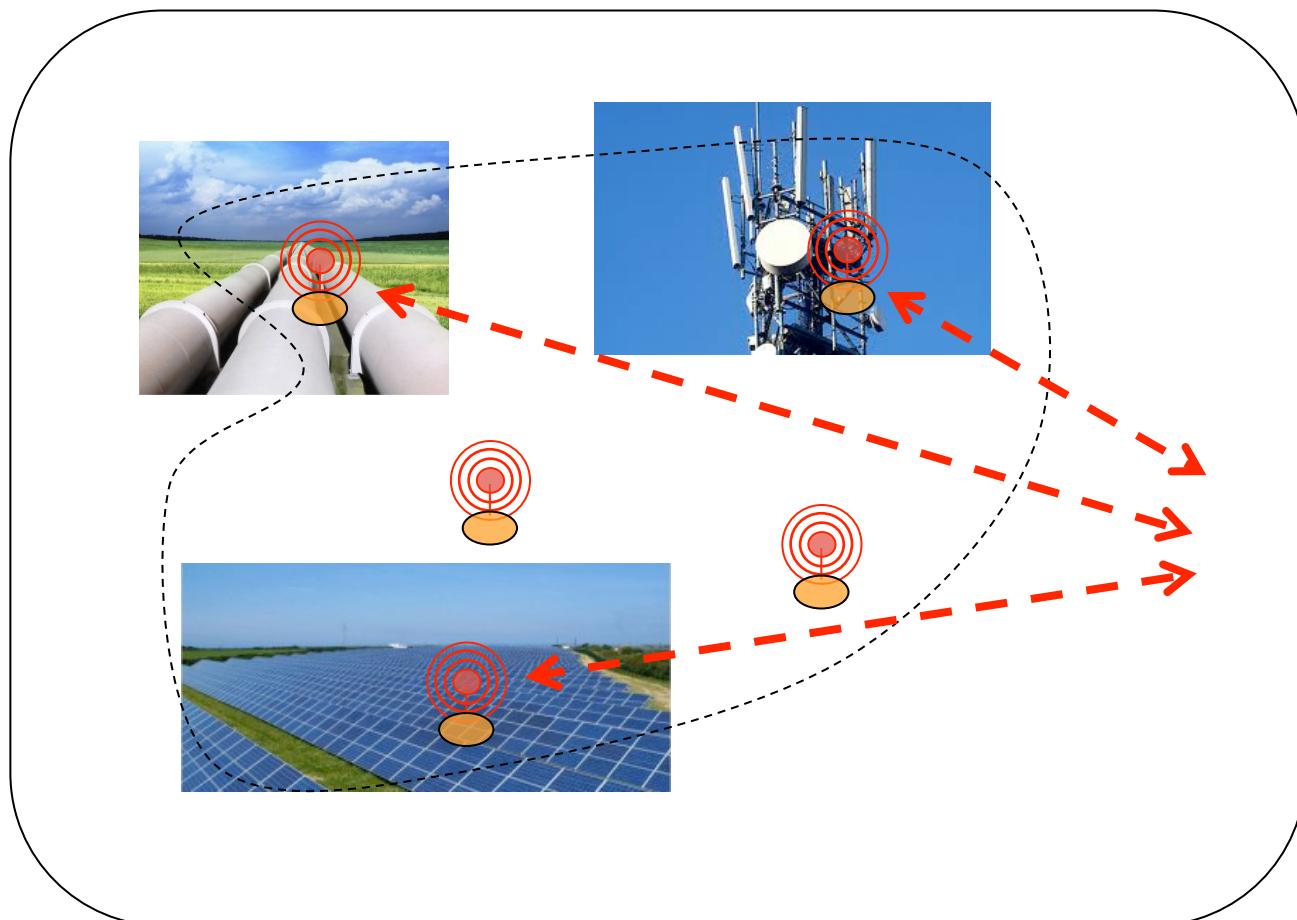

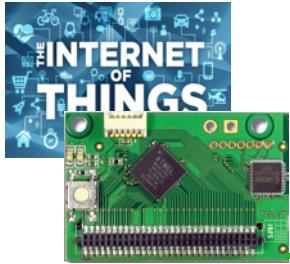

PROF. CONG DUC PHAM  
[HTTP://WWW.UNIV-PAU.FR/~CPHAM](http://www.univ-pau.fr/~cpham)  
UNIVERSITÉ DE PAU, FRANCE

# SENSORS/IOT FOR SURVEILLANCE

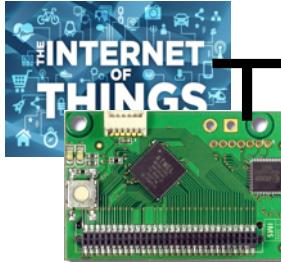

# CONNECTIVITY IS A CHALLENGE

## Internet of Objects 80% of volume

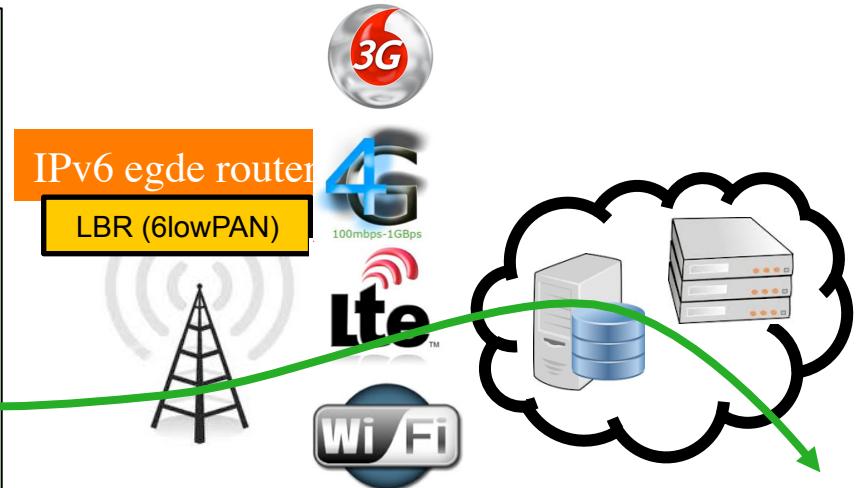

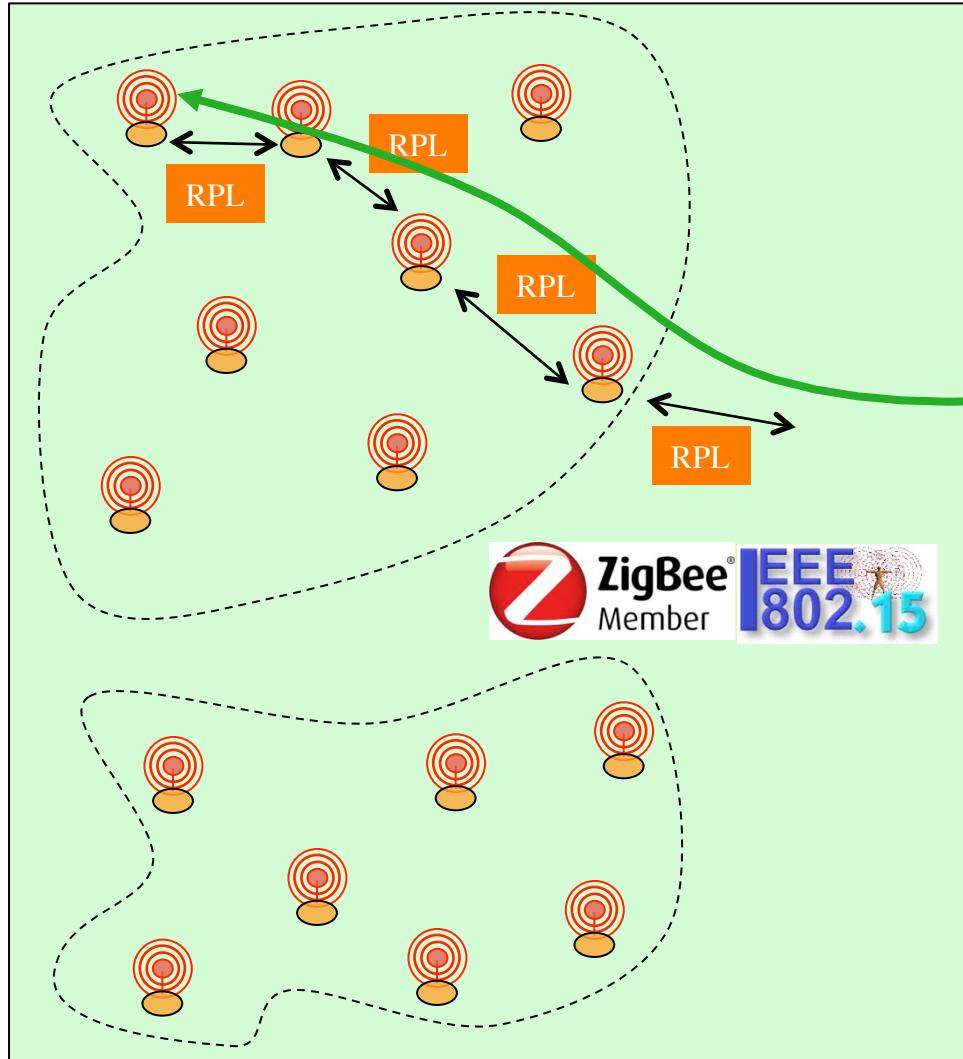

## Requirements:

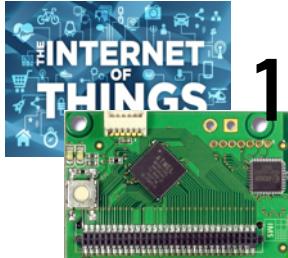

- How to connect Low Cost Assets or having no Energy source, non rechargeable?
- Low Cost communication
- Low Cost Infrastructure
- Low Power Technology
- Robust Communication
- Allowing Mobility
- Scalability

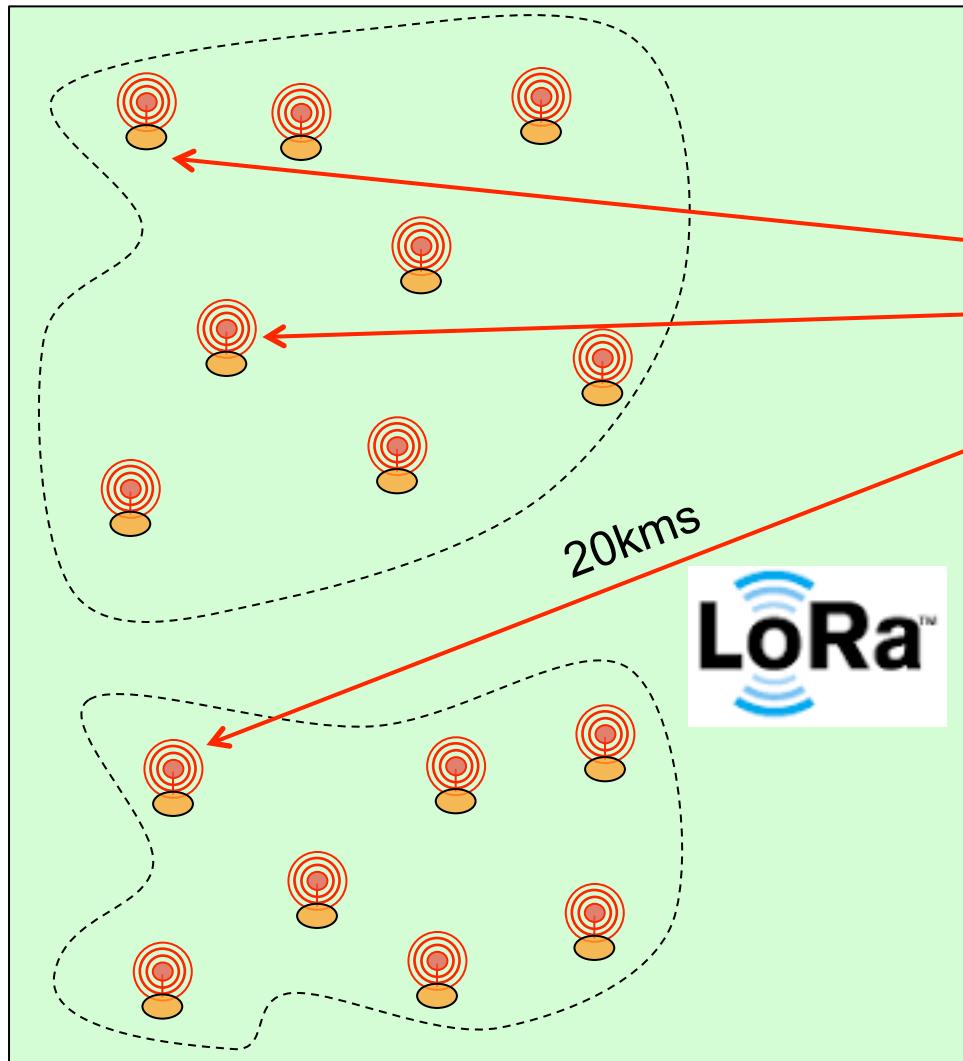

# TRADITIONAL MULTI-HOP TO SINK

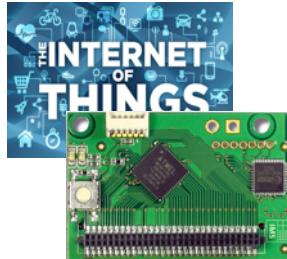

TOO COMPLEX AND TOO COSTLY TO DEPLOY AND MAINTAIN INTERMEDIATE NODES!

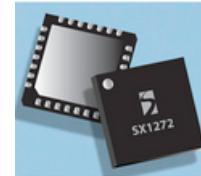

# 1-HOP TO SINK WITH LONG-RANGE TECHNOLOGY

Long-range technologies  
(Semtech's LoRa™ for  
instance) reduces the cost of  
deployment

# SEMTECH'S LoRA TECHNOLOGY

**dBm** – power referred to 1 mW,

$$P_{\text{dBm}} = 10 \log(P/1\text{mW})$$

## □ Parameters

- Bandwidth: 125kHz, 250kHz, 500kHz
- Coding rate: 4/5, 4/6, 4/7, 4/8
- Spreading factor: 6 to 12

Sensitivity: lowest input power with acceptable link quality, typically 1% PER

SpreadingFactor (RegModemConfig2)	Spreading Factor (Chips / symbol)	LoRa Demodulator SNR
6	64	-5 dB
7	128	-7.5 dB
8	256	-10 dB
9	512	-12.5 dB
10	1024	-15 dB
11	2048	-17.5 dB
12	4096	-20 dB

Bandwidth (kHz)	Spreading Factor	Nominal Rb (bps)	Sensitivity (dBm)
125	6	9380	-122
125	12	293	-137
250	6	18750	-119
250	12	586	-134
500	6	3750	-116
500	12	1172	-131

### Rule of thumb

6dB increase = twice the range in LOS

12dB needed for urban areas

Bandwidth (kHz)	Spreading Factor	Coding rate	Nominal Rb (bps)	Sensitivity (dBm)
125	12	4/5	293	-136
250	12	4/5	586	-133
500	12	4/5	1172	-130

DataRate	Configuration	Indicative physical bit rate [bit/s]	TXPower	Configuration
0	LoRa: SF12 / 125 kHz	250	0	20 dBm (if supported)
1	LoRa: SF11 / 125 kHz	440	1	14 dBm
2	LoRa: SF10 / 125 kHz	980	2	11 dBm
3	LoRa: SF9 / 125 kHz	1760	3	8 dBm
4	LoRa: SF8 / 125 kHz	3125	4	5 dBm
5	LoRa: SF7 / 125 kHz	5470	5	2 dBm
6	LoRa: SF7 / 250 kHz	11000	6..15	RFU
7	FSK: 50 kbps	50000		
8..15	RFU			

Table 14: Data rate and TX power table

## ☐ Minimum set

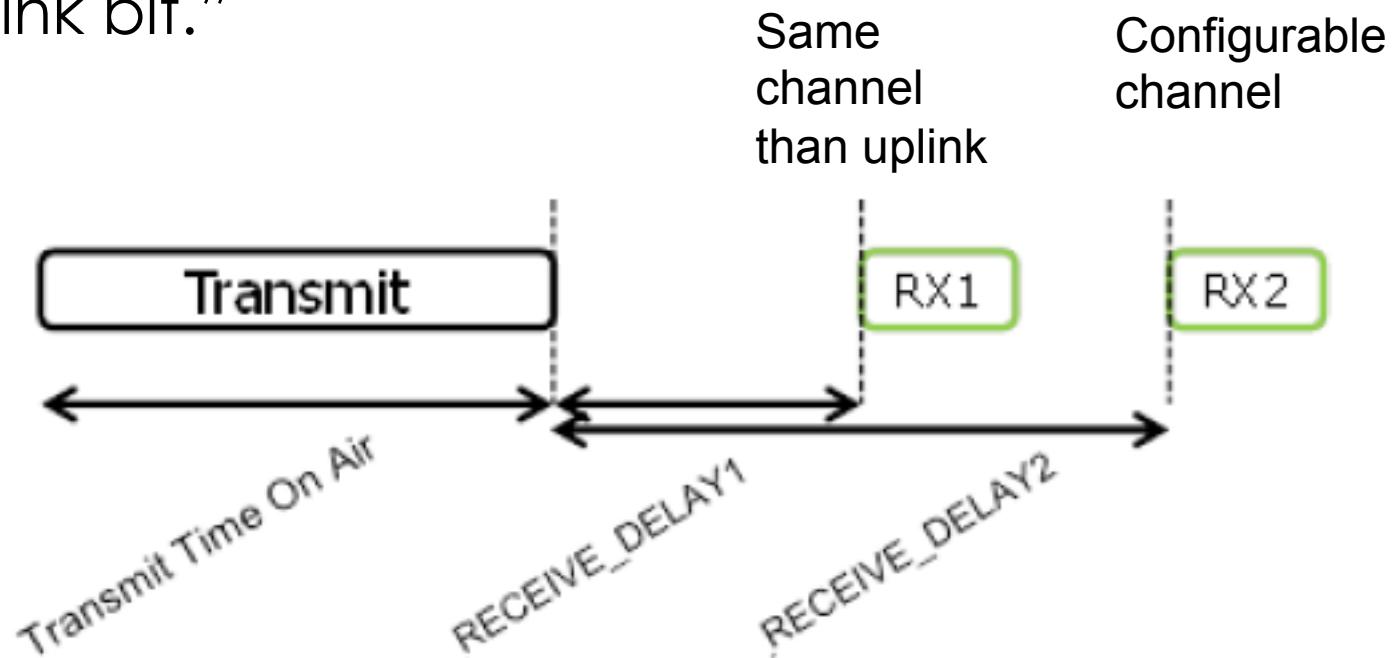

Modulation	Bandwidth [kHz]	Channel Frequency [MHz]	FSK Bitrate or LoRa DR / Bitrate	Nb Channels	Duty cycle
LoRa	125	868.10 868.30 868.50	DR0 to DR5 / 0.3-5 kbps	3	<1%

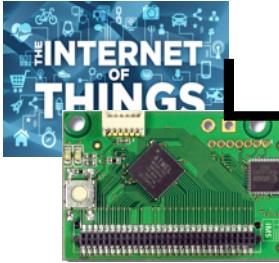

Table 12: EU863-870 default channels

# LORAWAN MAC PROTOCOL MAIN FEATURES (1)

- “Following each uplink transmission the end-device opens two short receive windows. The receive window start times is a configured periods are the end of the transmission of the last uplink bit.”

# LORAWAN MAC PROTOCOL MAIN FEATURES (2)

- Adaptive Data Rate, ACKnowlegements, Retransmission procedure, Encryption
- Duty-cycle and channel management

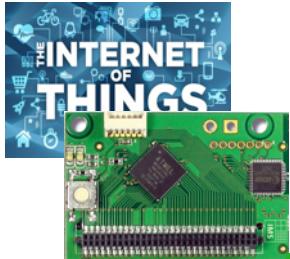

- The maximum end-device transmit duty cycle is:

$$\text{aggregated duty cycle} = \frac{1}{2^{\text{MaxDCycle}}}$$

- The valid range for **MaxDCycle** is [0 : 15]. A value of 0 corresponds to —no duty cycle limitation except the one set by the regional regulation (e.g. 1%)

- Channel off-time after transmission

$$T_{\text{off}_{\text{subband}}} = \frac{\text{TimeOnAir}}{\text{DutyCycle}_{\text{subband}}} - \text{TimeOnAir}$$

# COMMERCIAL LoRa GATEWAYS

- ❑ Most of them use the SX1301 which is a « Base Band Processor for Data Concentrator for Long Range Communication Network”
- ❑ Main feature is simultaneous reception on several channels

Semtech IoT starter

IMST iC880A

Multitech mCard-LoRa

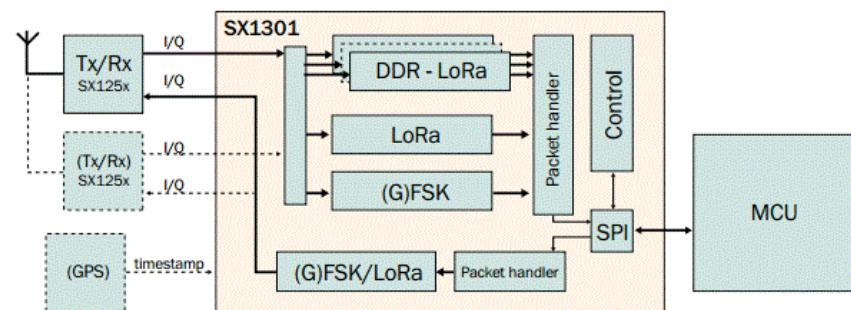

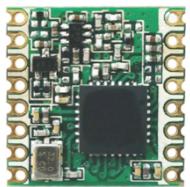

Figure from Semtech

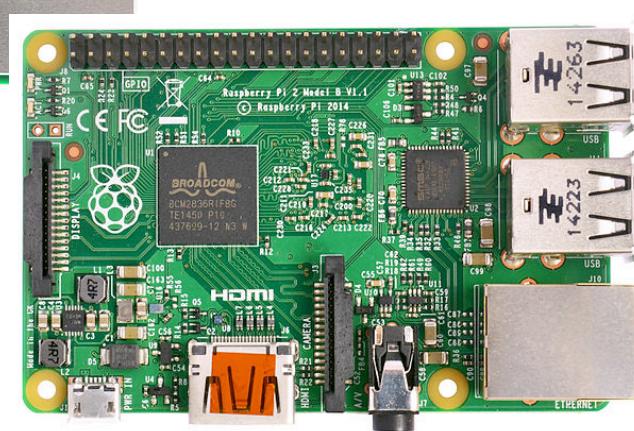

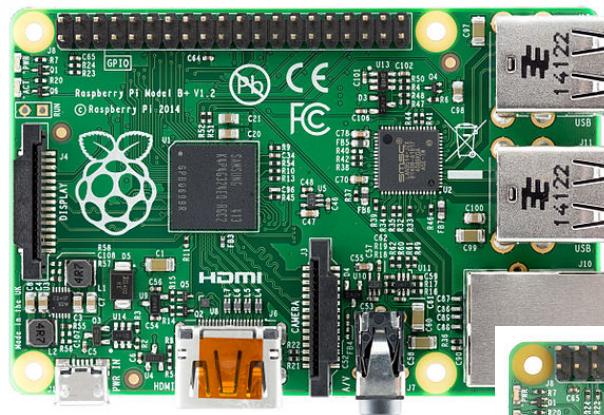

# LOW-COST LORA GATEWAYS

- ❑ Commercial gateways
  - ❑ cost hundredths of euros or dollars
  - ❑ are sometimes non-open source or difficult to customize
- ❑ Low-cost gateways can be built for medium-scale ad-hoc deployment scenarios
  - ❑ Use regular SX1272/76 chip for « single connection » from end-devices to the gateway
  - ❑ Use off-the-shelf embedded UNIX platforms for much lower-cost and easy enhancement
  - ❑ Use standard UNIX tools and high-level language for maximum flexibility and evolution
  - ❑ Use freely available cloud-based data management tools and middleware

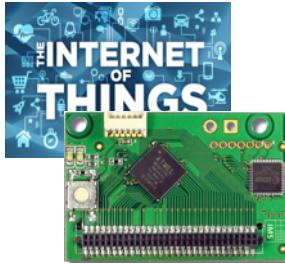

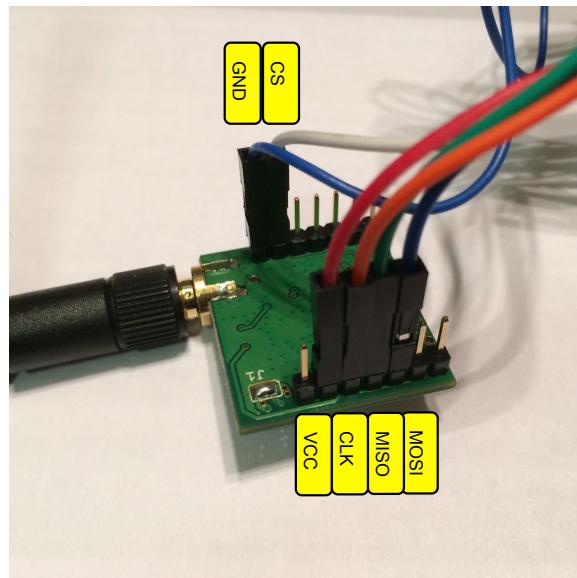

# RASPBERRY-BASED LORA GATEWAY

You can use Raspberry 1 model B or B+ or Raspberry 2 model B. The most important useful feature is the Ethernet interface for easy Internet connection. You can use WiFi to get Internet connection by adding a WiFi USB dongle.

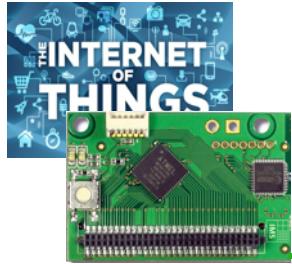

# CONNECTING THE RADIO MODULE

GPIO#	2nd func.	Pin#	Pin#	2nd func.	GPIO#
	+3.3 V	1	2	+5 V	
2	SDA1 (I2C)	3	4	+5 V	
3	SCL1 (I2C)	5	6	GND	
4	GCLK	7	8	TXD0 (UART)	14
	GND	9	10	RXD0 (UART)	15
17	GEN0	11	12	GEN1	18
27	GEN2	13	14	GND	
22	GEN3	15	16	GEN4	23
	+3.3 V	17	18	GEN5	24
10	MOSI (SPI)	19	20	GND	
9	MISO (SPI)	21	22	GEN6	25
11	SCLK (SPI)	23	24	CE0_N (SPI)	8
	GND	25	26	CE1_N (SPI)	7
(RPi 1 Models A and B stop here)					
EEPROM	ID_SD	27	28	ID_SC	EEPROM
5	N/A	29	30	GND	
6	N/A	31	32		12
13	N/A	33	34	GND	
19	N/A	35	36	N/A	16
26	N/A	37	38	Digital IN	20
	GND	39	40	Digital OUT	21

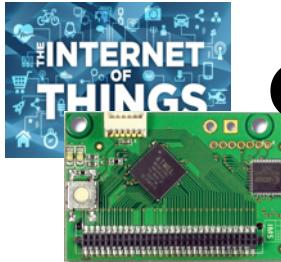

Depending on the model, you can have the « short » or the « long » GPIO interface. However, the SPI pins are at the same location therefore it does not change the way you connect the radio module if you take pin 1 as the reference. Connect the SPI pins (MOSI, MISO, CLK, CS) of the radio to the corresponding pins on the RPI. Note that CS goes to CE0\_N on the RPI.

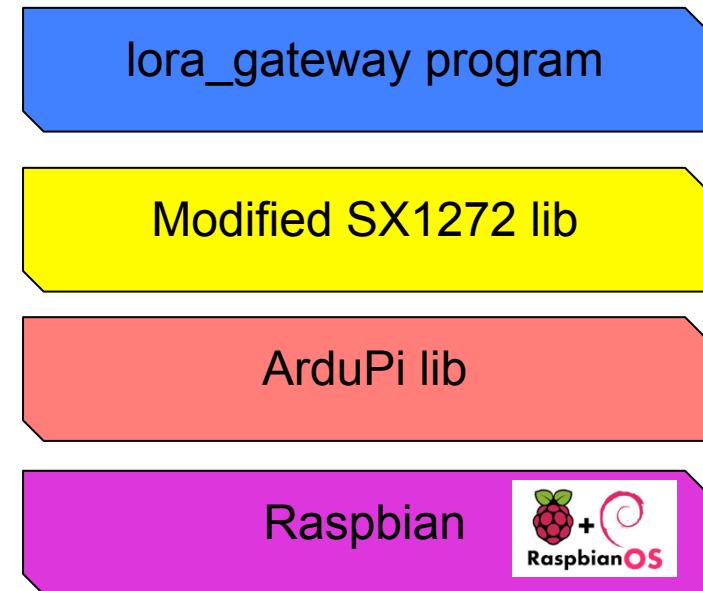

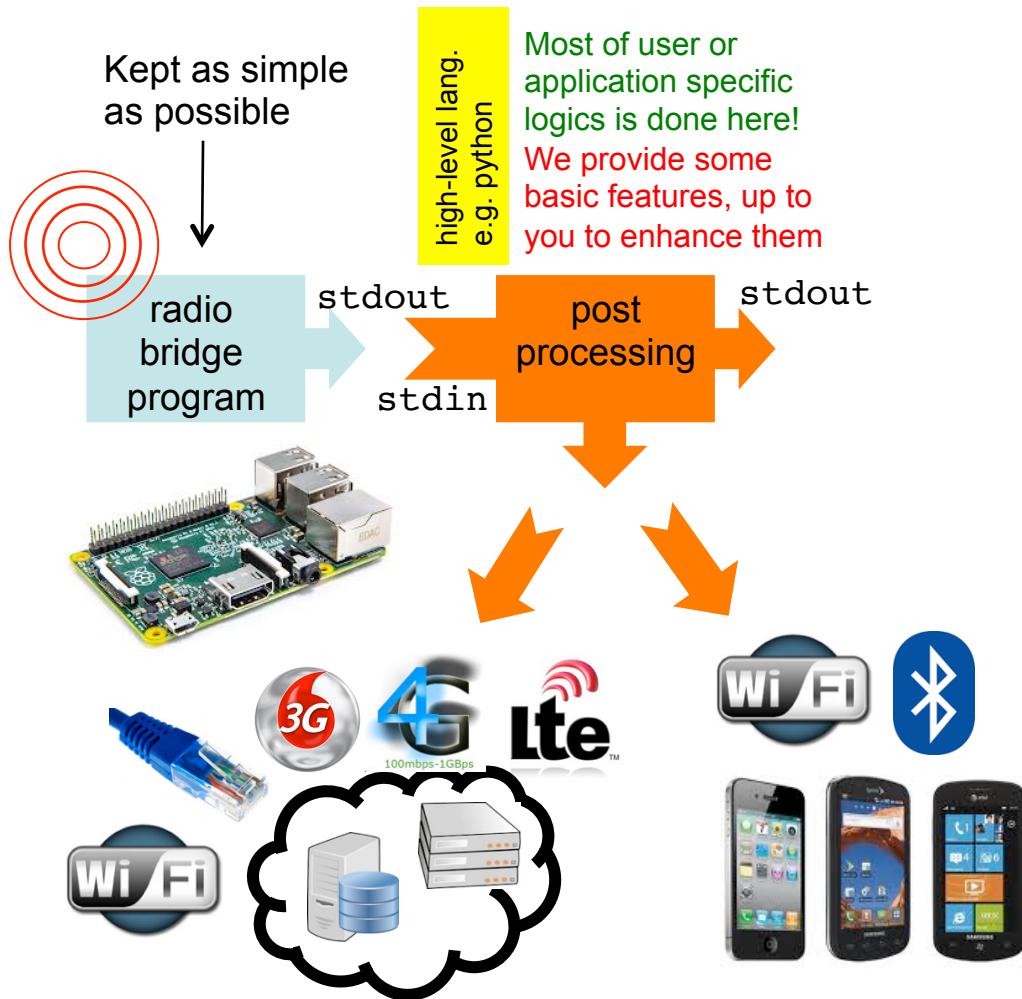

# PUT IT IN A BOX

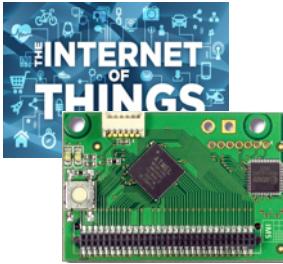

You can have a more integrated version, with a box for outdoor usage and PoE splitter to power the Raspberry with the Ethernet cable. See how we also use a DC-DC converter to get the 5V for the RPI.

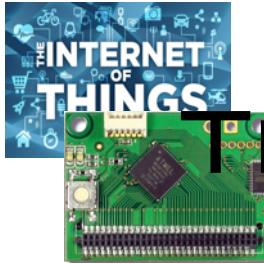

# OUR LOW-COST GATEWAY ARCHITECTURE

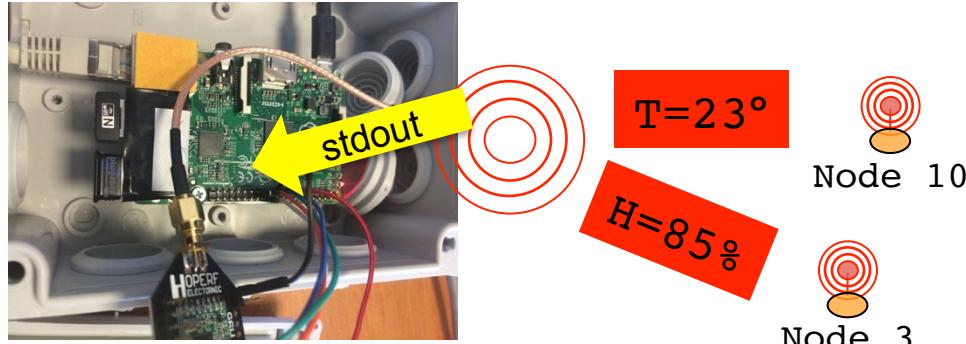

# OTHER DIY INITIATIVES

- ❑ piiinthesky
  - ❑ LoRa gateway by Dave Ackerman for High Altitude Ballooning
  - ❑ Nice work with ncurses and 'curl'-based upload
  - ❑ Too « monolithic », difficult to modify or adapt to new applications
- ❑ The Thing Network
  - ❑ « The Things » gateway with LoRaWAN
  - ❑ Detailed not very available yet
- ❑ Nestor Ayuso's Raspberry LoRa gateway
  - ❑ Raspberry PI+mCard (SX1301 concentrator) with LoRaWAN using LoRaMAC
- ❑ Our gateway
  - ❑ Raspberry PI+SX1272/76 for lower cost and medium-size deployment
  - ❑ No LoRaWAN to ease ad-hoc development & deployment
  - ❑ More elaborated channel access method and QoS proposals
  - ❑ Strong separation between gateway and post-processing
  - ❑ Should be seen as a starting point for user/application specific needs

# TRANSPARENT LORA BRIDGE

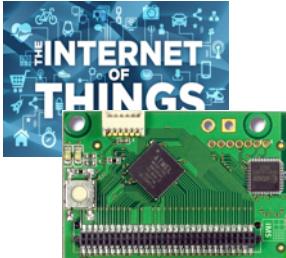

```
> sudo ./lora_gateway
Power ON: state 0
LoRa mode: 4
Setting mode: state 0
Channel CH_10_868: state 0
Power M: state 0
Get Preamble Length: state 0
Preamble Length: 8
LoRa addr 1 : state 0
SX1272/76 configured as LR-BS. Waiting RF input for transparent RF-serial bridge

--- rxlora. dst=1 type=0x10 src=10 seq=0 len=5 SNR=9 RSSIpkt=-54
^p1,16,10,0,5,9,-54
T=23°
--- rxlora. dst=1 type=0x10 src=3 seq=0 len=5 SNR=8 RSSIpkt=-54
^p1,16,3,0,5,8,-54
H=85%
```

Accepts remote commands to:

- Change LoRa mode
- Change channel
- Change transmission power
- Enable/Disable ACK
- ...

# POST-PROCESSING RECEIVED DATA

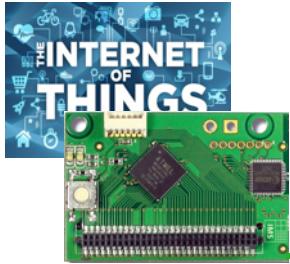

- Pre-defined sequences inserted by the gateway or the end-device allow for information exchanged between the gateway and the post-processing program

```
> sudo ./lora_gateway | python ./parseLoRaStdin.py
Power ON: state 0
LoRa mode: 4
Setting mode: state 0
Channel CH_10_868: state 0
Power M: state 0
Get Preamble Length: state 0
Preamble Length: 8
LoRa addr 1 : state 0
SX1272/76 configured as LR-BS. Waiting RF input for transparent RF-serial bridge

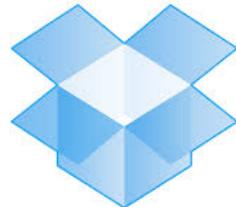

--- rxlora. dst=1 type=0x10 src=10 seq=0 len=5 SNR=9 RSSIpkt=-54
^p1,16,10,0,5,9,-54
Rcv ctrl packet info 1,16,10,0,5,9,-54
(dst=1 type=0x10 src=10 seq=0 len=5 SNR=9 RSSI=-54)
T=23°
--- rxlora. dst=1 type=0x10 src=3 seq=0 len=5 SNR=8 RSSIpkt=-54
^p1,16,3,0,5,8,-54
Rcv ctrl packet info 1,16,3,0,5,8,-54
(dst=1 type=0x10 src=3 seq=0 len=5 SNR=8 RSSI=-54)
H=85%
```

All lines that are not prefixed by specific character sequence are displayed unchanged

<sup>^p</sup> provides information on the last received packet: dst, type, src, seq, len, SNR & RSSI

# IOT CLOUD?

```

\\$ or \& before the data indicates that the data should be logged on a file or server. It is up to the end-device to decide which option

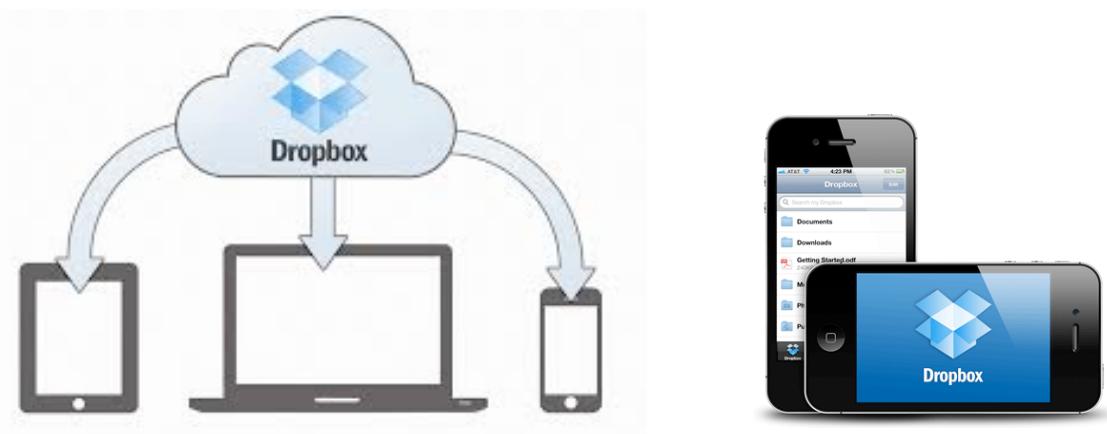

# USING

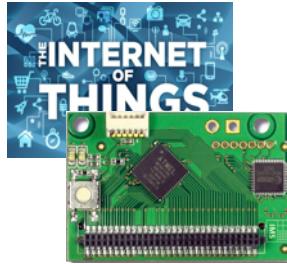

- ❑ A message starting with '\\$' is logged in a file 'telemetry.log' in a folder shared through Dropbox

```
(src=10 seq=0 len=5 SNR=9 RSSI=-54) 2015-11-04T10:14:30.328413> T=23°  
(src=10 seq=1 len=7 SNR=8 RSSI=-54) 2015-11-04T10:14:37.443350> T=23.2°  
(src=10 seq=2 len=5 SNR=8 RSSI=-53) 2015-11-04T10:16:23.343657> T=24°  
...
```

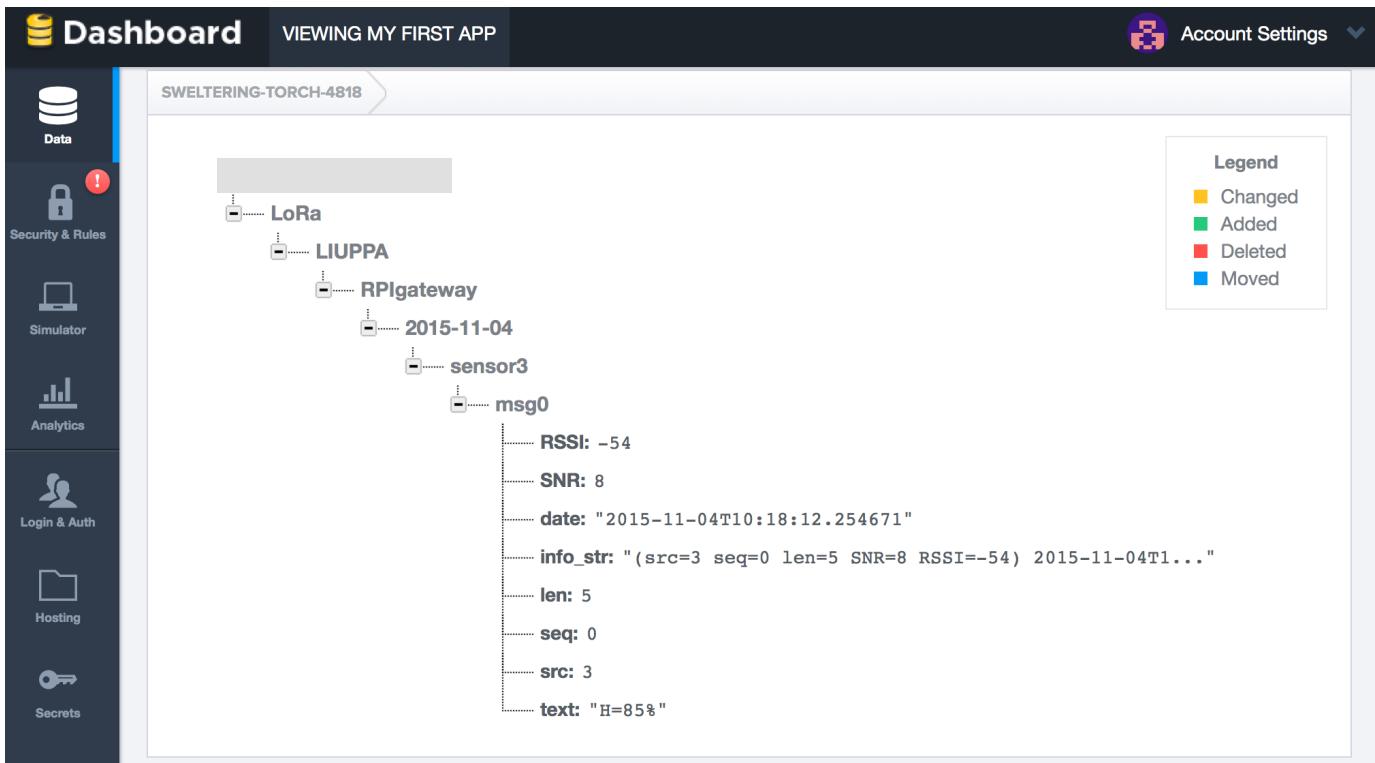

\\$T=23°  
  
Node 10

# USING Firebase

- ☐ A message starting with '\&' is logged in a Firebase database

The screenshot shows the Firebase Database dashboard with the following details:

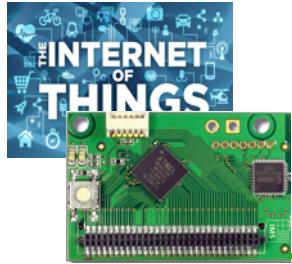

- Project:** SWELTERING-TORCH-4818
- Database Structure:**
  - LoRa
  - LIUPPA
  - RPIgateway
  - 2015-11-04
    - sensor3
      - msg0
        - RSSI: -54
        - SNR: 8
        - date: "2015-11-04T10:18:12.254671"
        - info\_str: "(src=3 seq=0 len=5 SNR=8 RSSI=-54) 2015-11-04T1..."
        - len: 5
        - seq: 0
        - src: 3
        - text: "H=85%"

**Legend:**

- Changed (Yellow)
- Added (Green)
- Deleted (Red)
- Moved (Blue)

**Node 3 Data:**

- \&H=85%
- Node 3

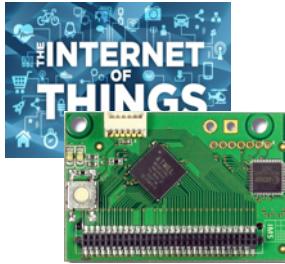

# USING ThingSpeak

- ❑ A message starting with '\!' is logged in a ThingSpeak channel

The screenshot shows the ThingSpeak website. At the top, there's a navigation bar with the ThingSpeak logo, 'Channels', 'Apps', 'Blog', and 'Support'. Below the navigation, it says 'User: cpham'. On the left, there's a sidebar for 'Test LoRa UPPA' with details: Channel ID: 66583, Author: cpham, and a description: 'Test of LoRa gateway at University of Pau, France'. At the bottom of the sidebar, it says 'Test, lora, uppa'. In the center, there's a red box containing the message '\!#19.6' above a circular antenna icon labeled 'Node 10'. Below this, another red box contains the message '\!write\_key#field\_index#19.6'.

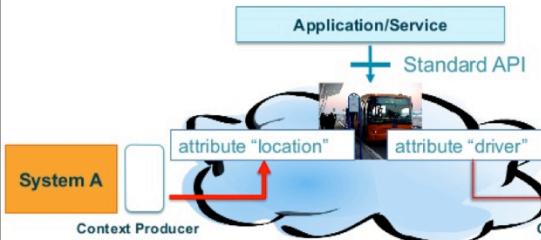

# USING FIWARE CLOUD

- ☐ FIWARE support has been added with EGM script

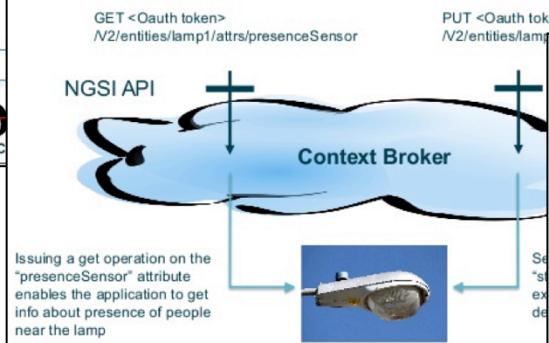

## A non-intrusive approach is required

- Capable to integrate with existing or future systems dealing with management of municipal services without impact in their architectures
- Info about attributes of one entity may come from different systems, which work either as Context Producers or Context Consumers
- Applications rely on a single model adapting to system

## Connecting to the Internet of Things

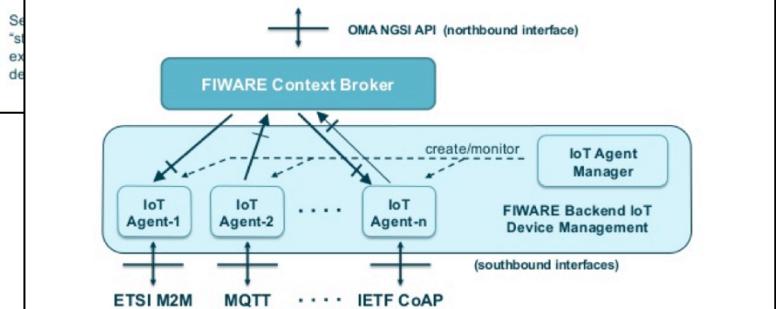

- Capturing data from, or Acting upon, IoT devices should be as easy as to read/change the value of attributes linked to context entities

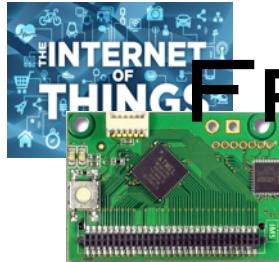

Figures from FIWARE

## Integration with sensor networks

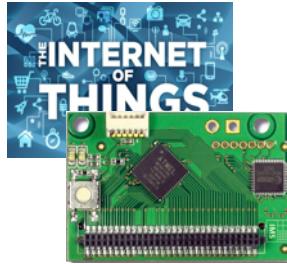

- FIWARE NGSI is capable to deal with the wide variety of IoT protocols today
- Rather than trying to solve the battle of standards at IoT level, it brings a standard where no standard exists today: context information management

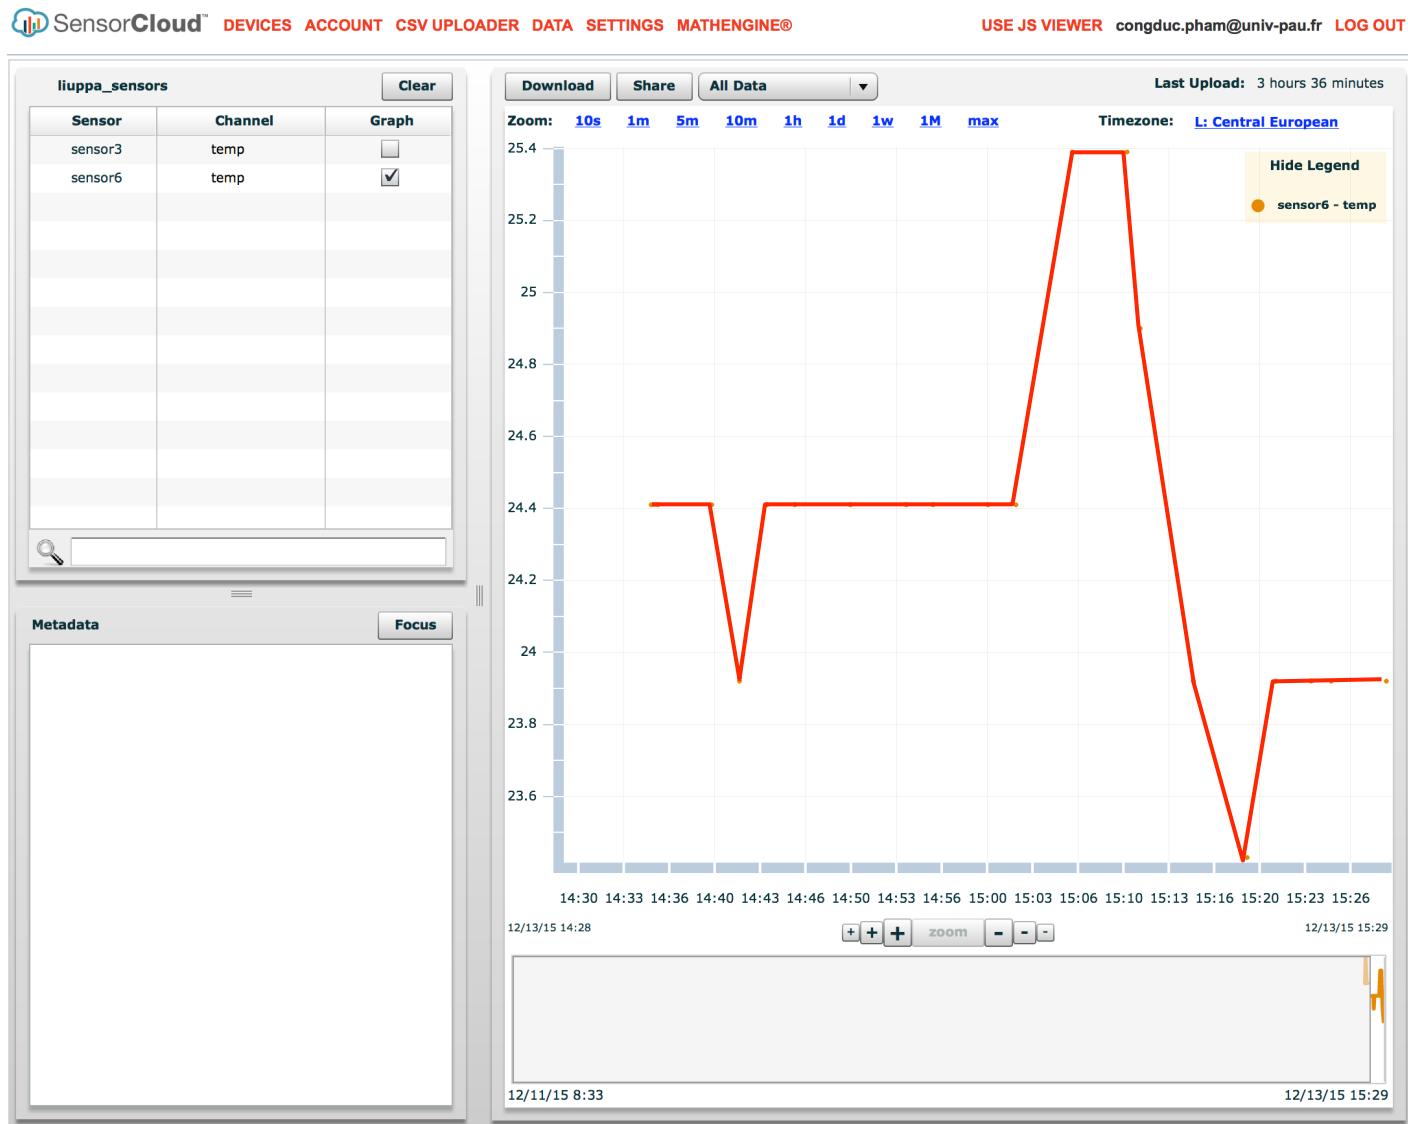

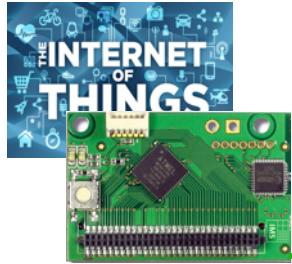

# FREEBOARD IoT CLOUD WITH FIWARE

The image shows the Freeboard IoT Cloud interface. At the top left is a logo for "THE INTERNET OF THINGS". The main title is "FREEBOARD IoT CLOUD WITH FIWARE". Below the title is a screenshot of the Freeboard interface. The interface has a dark theme. On the left, there are two temperature gauges: one for "Temperature of sensor 3" showing 22 °C and one for "Temperature of sensor 10" showing 20.5 °C. On the right, there is a "DATASOURCES" section listing three entries: "MyDevice" (never), "fiware testing of sensor3" (09:13:39), and "fiware testing of sensor10" (09:14:34). Below the list is an "ADD" button. In the center, there is a screenshot of a mobile phone displaying a ThingSpeak dashboard. The phone's status bar shows "Revenir à Mail" and "10:12". The ThingSpeak dashboard shows two charts: "Field 1 Chart" for "Temp for sensor 3" and "Field 2 Chart" for "Temp for sensor 10". Both charts show temperature data over time. A red box highlights this central area. To the right of the phone screenshot is another screenshot of the Freeboard app running on the phone. This screenshot shows the same two temperature gauges as the desktop interface. The phone's status bar also shows "10:12". At the bottom of the phone screen, there is a navigation bar with icons for back, forward, search, and others.

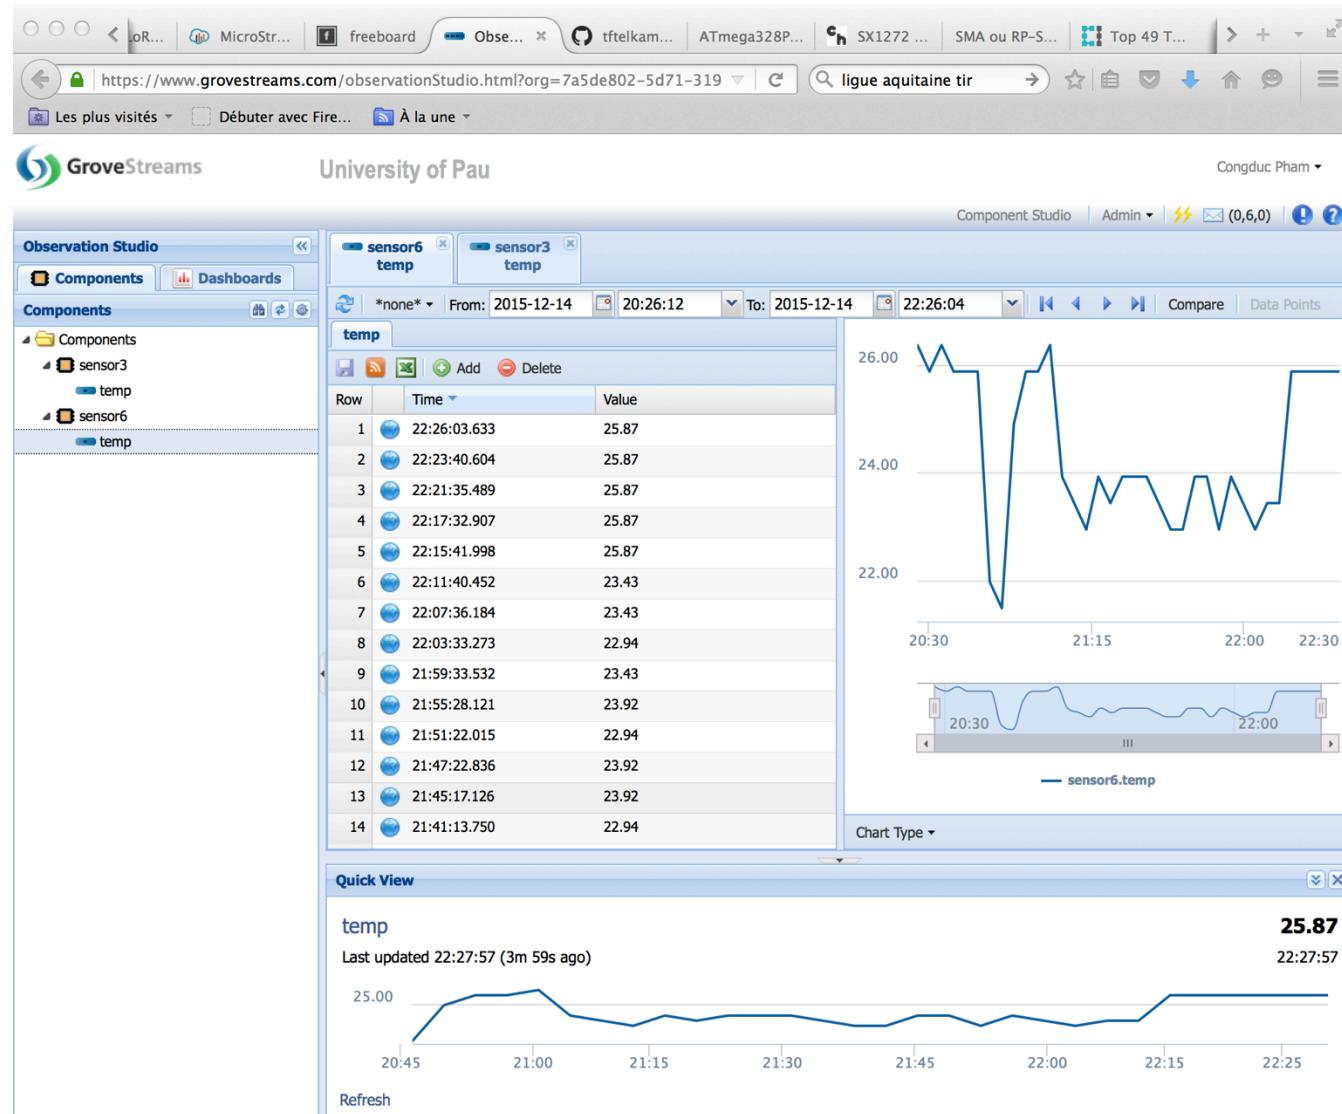

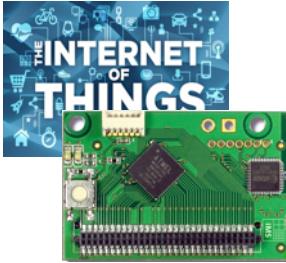

# USING SensorCloud™

# USING GroveStreams

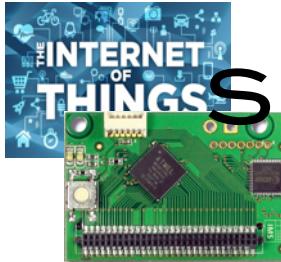

## GATEWAY LOGS

- Gateway message can also be logged in a local file system or on a Dropbox-shared folder
- The gateway simply prefix important output with '^\$' then post-processing can implement the logging service if desired

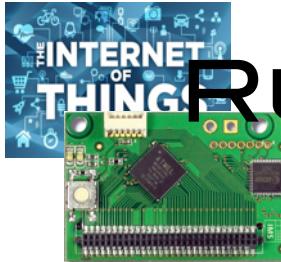

```
2015-11-06T17:32:17.133425> Power ON: state 0
2015-11-06T17:32:17.133425> LoRa mode: 4
2015-11-06T17:32:17.153508> Setting mode: state 0

# GATEWAY FOR ON-THE-GO TESTS

- Use an Arduino board w/laptop as a transparent radio bridge

The image shows a desktop environment with two windows and a physical hardware setup.

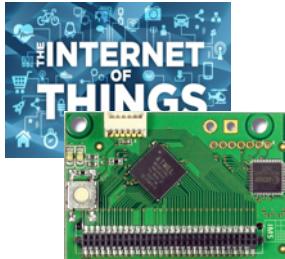

**Arduino IDE Window:** The title bar says "Arduino\_LoRa\_Gateway | Arduino 1.0.1". The main area displays the source code for the "Arduino\_LoRa\_Gateway" sketch. The code includes comments about the LoRa gateway functionality, copyright information (C) 2015 Congduc Pham, and details about the GNU General Public License. It also specifies version 0.9 and design by C. Pham. The code ends with a note about waiting for commands or data from the LoRa module.

**Terminal Window:** The title bar says "/dev/tty.usbmodem411". The terminal output shows the following text:

```
@M2#  
4572 bytes of free memory.  
...  
^*****Power ON: state 0  
^$Setting LoRa mode: 4  
^$LoRa mode: state 0

^$/@M2#  
^$Set LoRa mode to 2  
^$LoRa mode: state 0  
Get Preamble Length: state 0  
Preamble Length: 8
```

**Hardware Setup:** A photograph shows an Arduino Mega 2560 or Mega ADK board connected to a laptop via a USB cable. A yellow arrow points to the USB cable, and another yellow arrow points to the Arduino board with the label "USB-SERIAL".

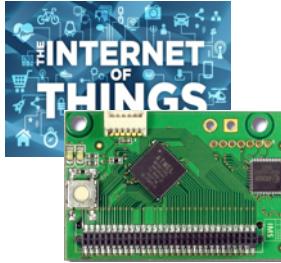

**Bottom Status Bar:** The status bar at the bottom of the terminal window shows "38400 baud" and "Pas de fin de ligne" (No line ending).

# ADDING FULL POST-PROCESSING

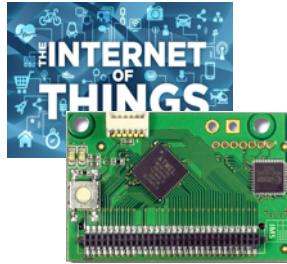

- ☐ Forward serial data to stdout, then use post-processing python scripts unchanged

```
administrator@ubuntu:~/Dropbox/LoRa$ python 38400SerialToStdout.py /dev/ttyACM0 | python ./parseLoRaStdin.py -a 3 -L | python ./l
teway.py -a 3
will use _3 for post-processing log file
will use _3 for gateway and telemetry log files
will log gateway message prefixed by ^$
4572 bytes of free memory.
...
rcv gw output to log (^$): *****Power ON: state 0

#2#19.53
```

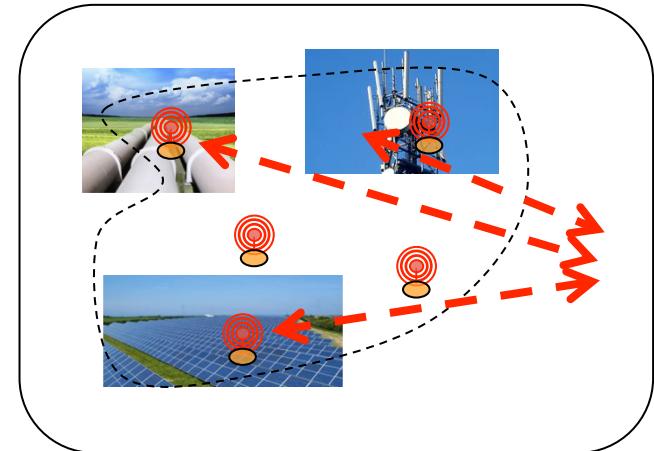

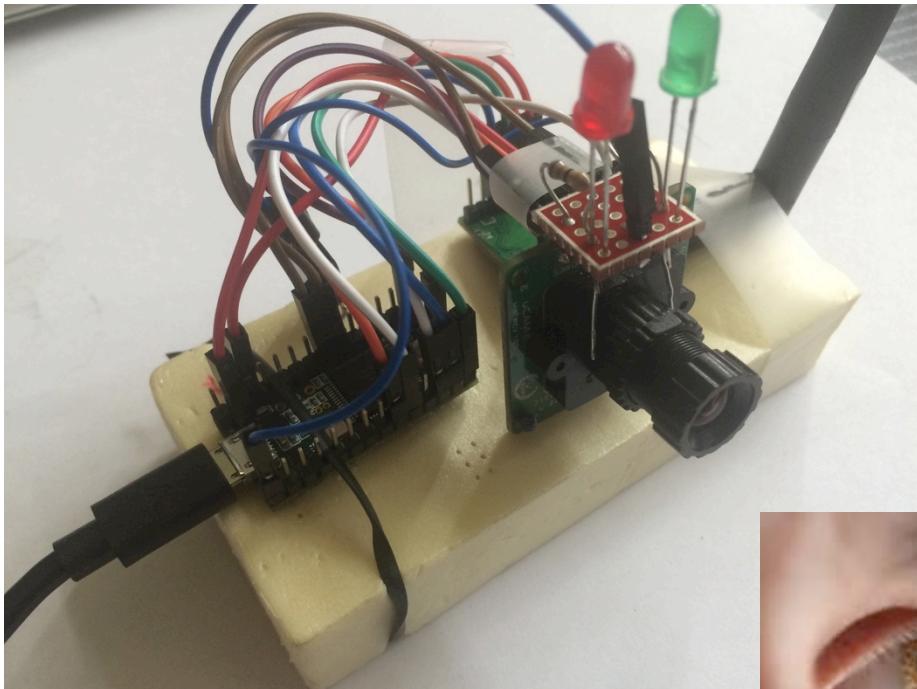

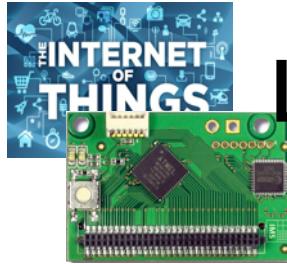

# ADVANCED FEATURES (1): ENCRYPTION

- ❑ The end-device encrypts the payload with AES-128
- ❑ The gateway forwards the encrypted payload to the post-processing stage (python)
- ❑ The post-processing stage can either be configured to
  - ❑ Decrypt the data and process decrypted data as usual. Need to store the AES key in the post-processing script
  - ❑ Push encrypted data to a client-managed server
- ❑ We demonstrate the flexibility of our architecture by implementing AES encrypt/decrypt just by adding a few lines of python code

Nancy, France. Very  
robust image encoding  
techniques against  
packet losses

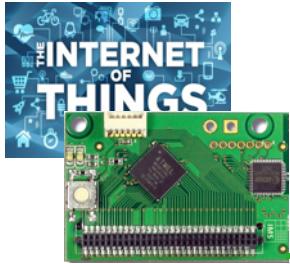

# RECEIVING IMAGES AT LoRA GATEWAY

- Current post-processing tasks are
  - look for framing bytes 0xFF0x55
  - get information on source node
  - create new entry for image source node if needed
  - save all image packets into a file that can be shared/uploaded and displayed at client side

```

# LoRA DEVICES & GATEWAYS

Regulations stipulate that **radio activity duty-cycle** should be enforced at **devices** and that end-users should not be able to modify it « easily ».

LoRaWAN specification from LoRa Alliance is a first attempt to standardize LoRa networks but **no issues on quality of service**.

**What if I still need to send more than 36s in the current hour because of an emergency situation?**

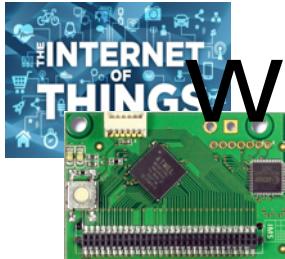

- stop transmitting?
- violate regulation?

LR-BS

100Mbps-1Gbps

Optimized image encoding at medium quality: 16384b down to 1366b (ratio 12).

Will generate 7 pkts using 250 max payload

$$7 * 9.15 = 64.05\text{s}$$

$$7 * 1.96 = 13.72\text{s}$$

# DEPLOYING YOUR LORA NETWORK

## OPERATOR-BASED APPROACH (ON SUBSCRIPTION)

## PRIVATELY-BASED APPROACH

Multitech Conduit

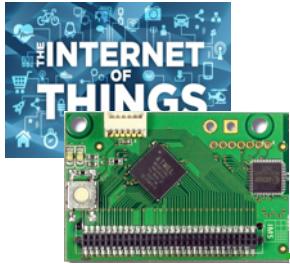

Kerlink  
IoT Station

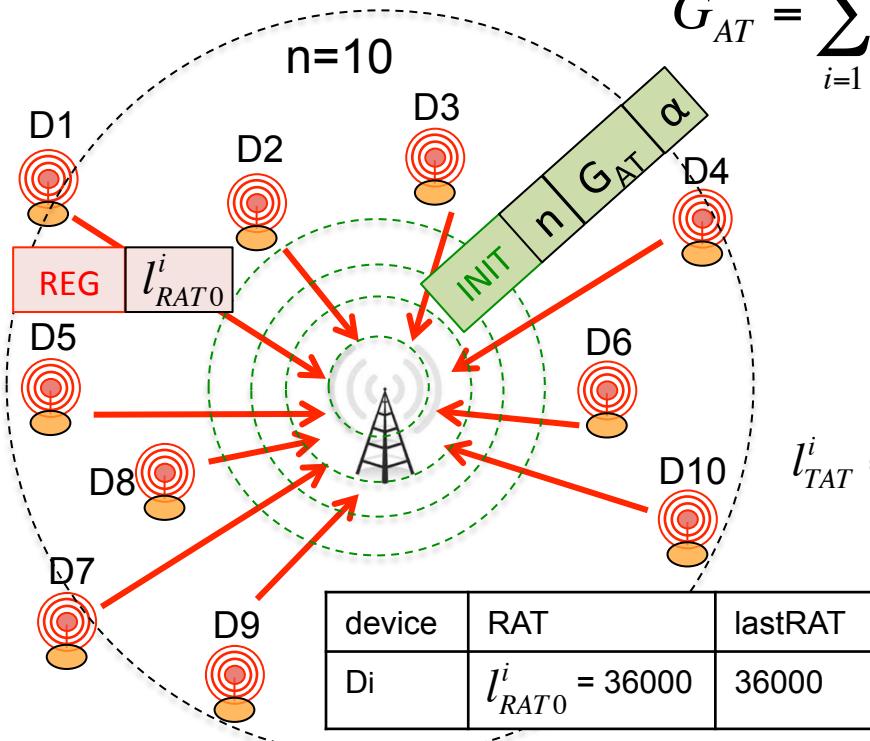

AND MUCH MORE...

Whatever the deployment approach, the gateway knows how many devices are deployed by a given organization

Our proposition is to view all device's activity time in a global manner, with the gateway taking care of radio time usage consistency

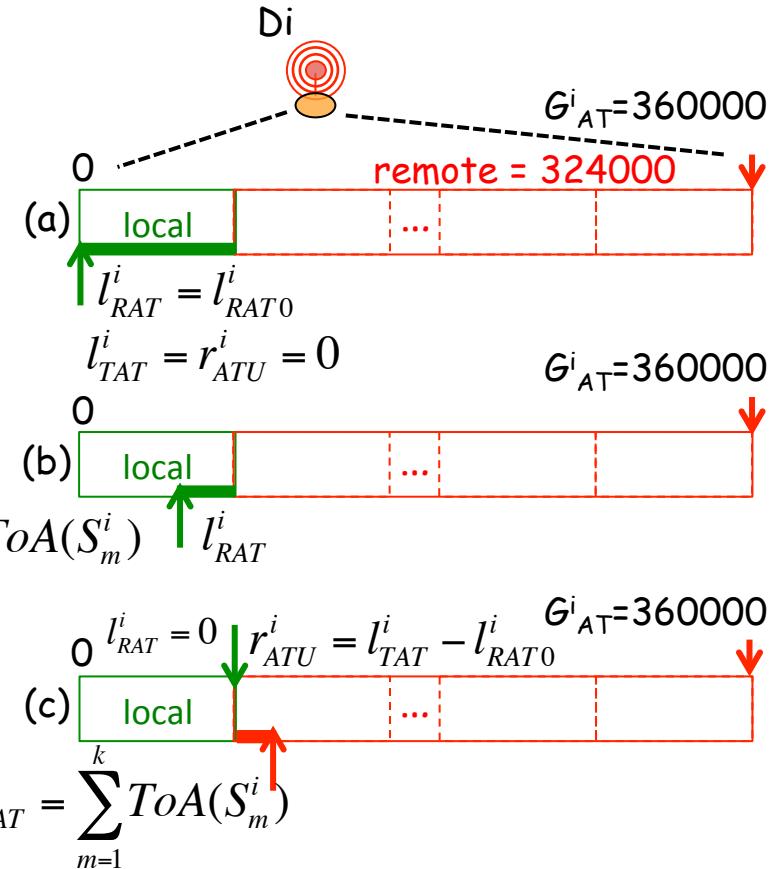

# LONG-RANGE ACTIVITY SHARING (LAS)

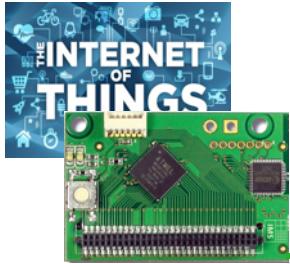

$$G_{AT} = \sum_{i=1}^n l^i_{RAT0}$$

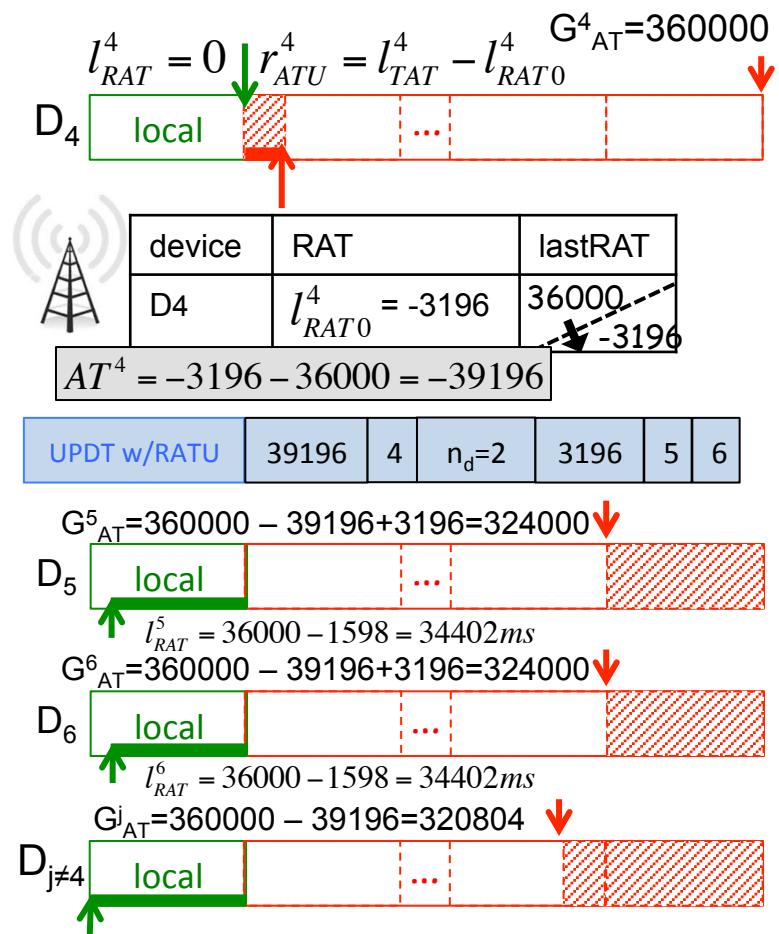

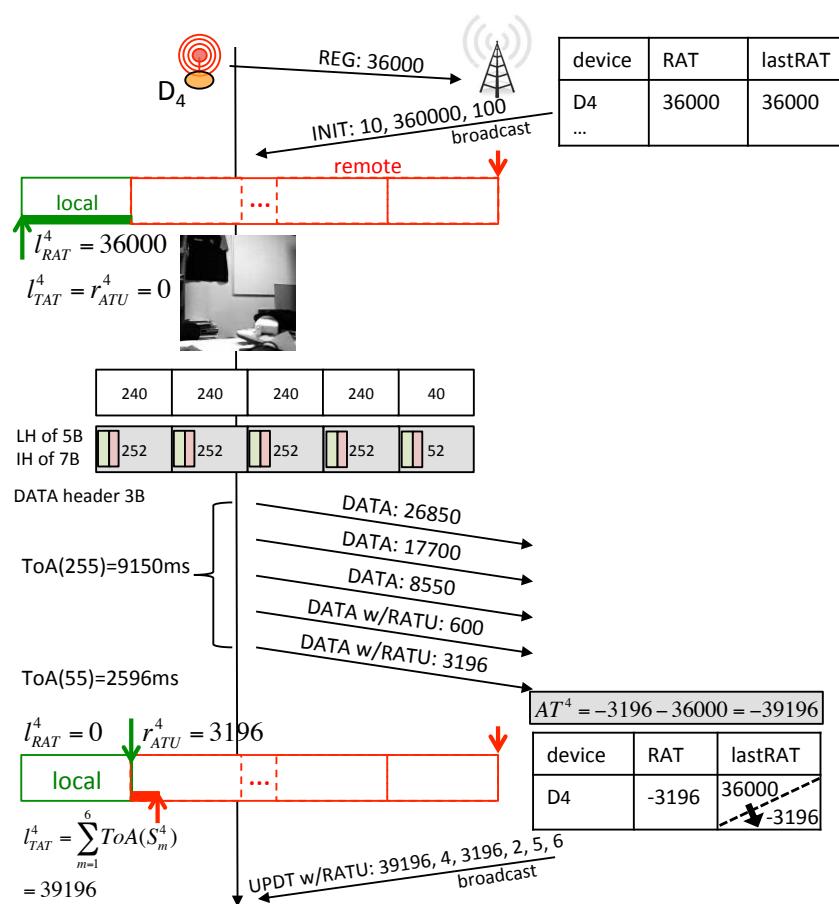

$$l^i_{TAT} = \sum_{m=1}^k ToA(S_m^i)$$

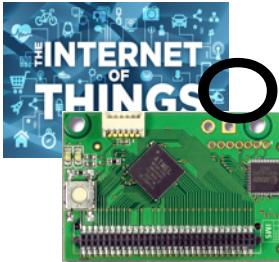

A device can transmit more if needed, provided that other devices will decrease their radio activity time accordingly.

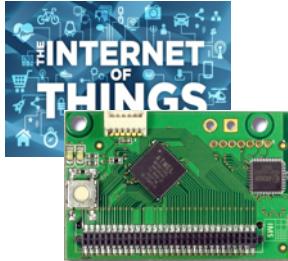

# DISTRIBUTING REMOTE ACTIVITY TIME USAGE

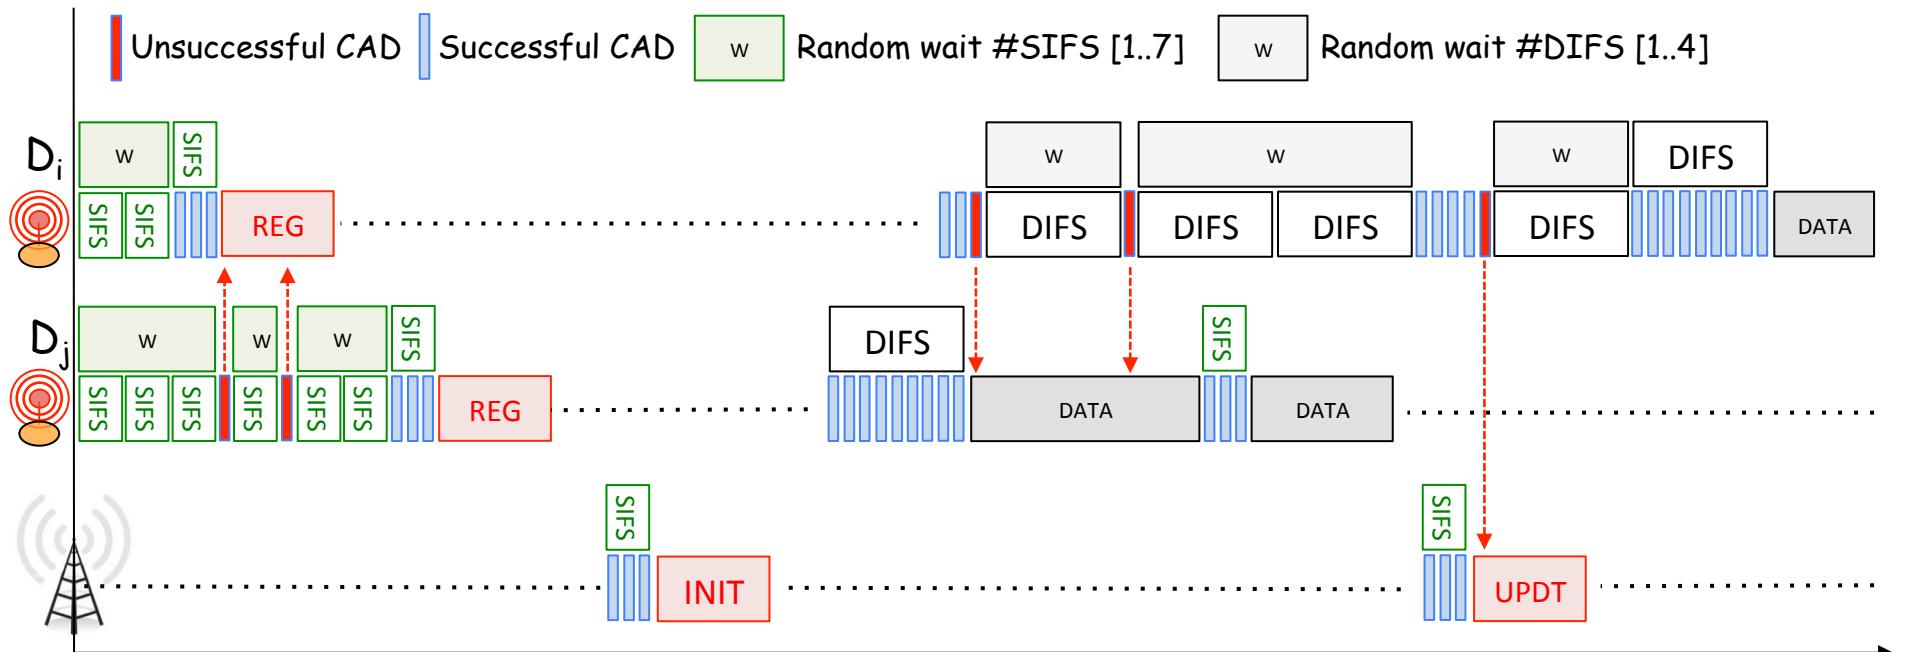

# OTHER ISSUES TO TAKE INTO ACCOUNT

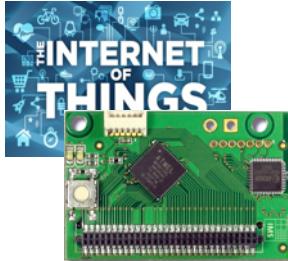

- ❑ Minimise the number of UPDT messages sent by the gateway because the gateway's radio time is also limited
  - ❑ UPDT can have cumulative behavior if no remote activity time has been used
- ❑ Support sleep periods of end-devices
  - ❑ The network is synchronized for control messages (REG, INIT, UPDT). UPDT msg that can not use cumulative behavior are queued for transmission at next transmission slot. At rcv, UPDT have to be applied sequentially.
- ❑ Maintain (loose) synchronization
  - ❑ If no UDPT are scheduled, the gateway periodically sends a BEACON. Clock drift is limited to a BEACON period
- ❑ Dynamic insertion of new end-devices
  - ❑ New devices can either stay out of the managed pool (then only 36s of activity time/h is allowed), or join by waiting for the next UPDT/BEACON msg
  - ❑ Every hour, end-devices decide if they want to join the pool or not
- ❑ Give priority to control msg
  - ❑ SIFS/DIFS mechanism are implemented using LoRa Channel Activity Detection
- ❑ Avoid interleaving of several image transmissions
  - ❑ Use DIFS for first image packet, then SIFS
- ❑ Improve LoRa network efficiency
  - ❑ Move from pure ALOHA to CSMA mechanism with CAD+RSSI tests prior to any transmission

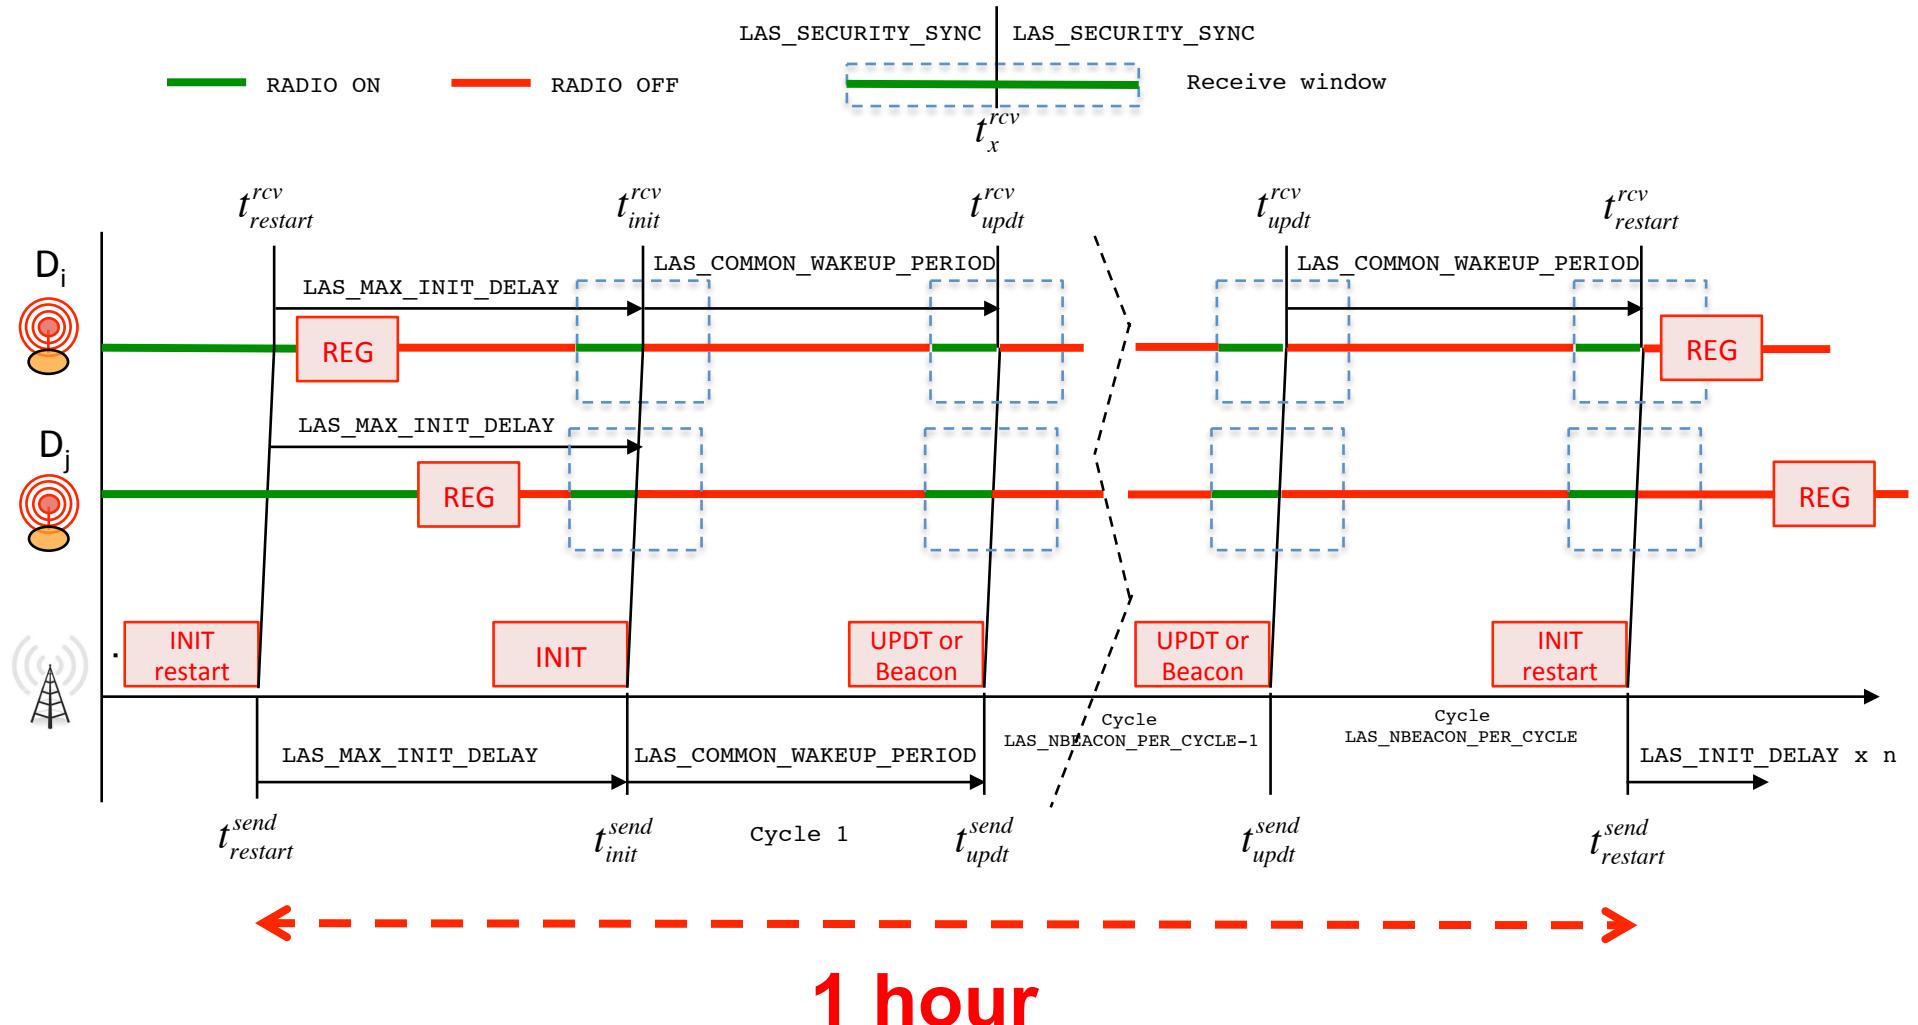

# ENHANCED CHANNEL ACCESS

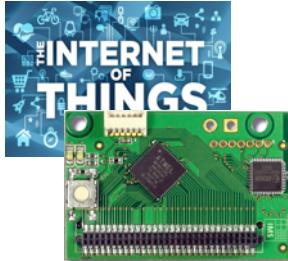

- Current LoRa networks are ALOHA system
- Our SX1272 modified library adds CSMA-like channel access and RSSI check before transmission

# SUMMARY OF GATEWAY-DEVICE SCHEDULING

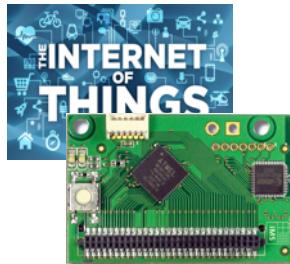

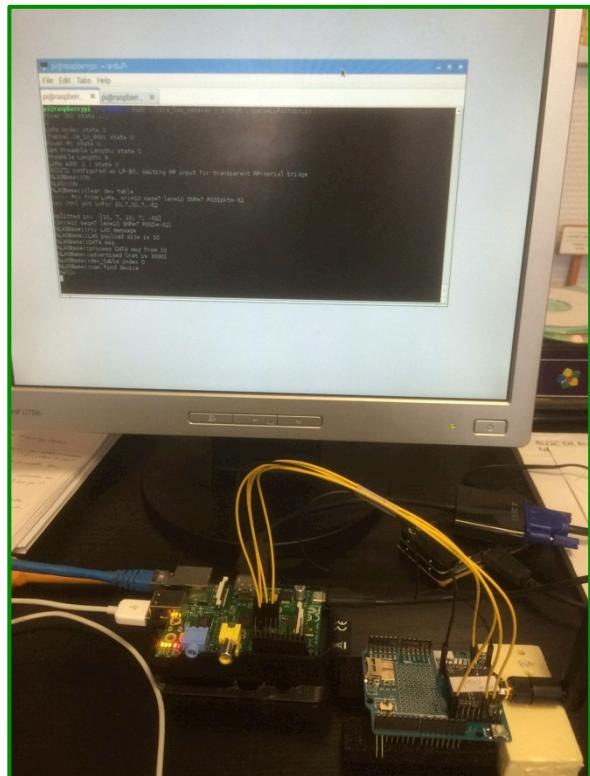

# IMPLEMENTATIONS & LIBRARIES

- Own gateway based either Raspberry PI or Arduino MEGA/Due with gateway LAS services
- C/C++ Library for end-devices to send data packets under LAS services. Radio duty-cycling and interactions with LAS gateway are performed automatically

# GATEWAY STARTUP

# CONCLUSIONS

---

- Long-range radios appear as a very promising technology to deploy sensors and so-called IoT devices without the complexity and cost of multi-hop networking
- A low-cost gateway for custom development initiatives
- More robust channel access method with CS/LBT features
- However, as the radio activity time is limited by regulations, it is difficult to guarantee a level of service of the deployed infrastructure, especially for some data-intensive applications
- We propose a Long-range Activity Sharing mechanism to manage a pool of deployed devices in a flexible manner
- Quality of Service can be ensured as devices can transmit critical information when needed

## ANNEX.1: PARTS LIST

- Raspberry 1 B+
- Micro SD card 8GB
- HopeRF RFM92W
- RFM92W adapter kit (including the straight break away headers and the antenna plug)
- Male SMA<> Female RP-SMA cable
- 868MHz antenna Male RP-SMA
- Some jumper wires F/F
- Some standoffs and screws
- Plastic box, waterproof
- Power
  - 2A USB AC/DC Power Charger Adapter + Micro USB Cable ...
  - Or PoE kit with a 5V regulator at the RPI side (shown in picture)
- A WiFi dongle (optional)
