Sensor Data Aggregation

Zaragoza

Adaptive infrastructure for sensor data analysis

- **Multiple** concurrent data streams with **SLA**
- **Variable** properties: rate and data types; various processing models
- Support for **in-transit** analysis, enforcing **QoS**
- Support for **admission** control & flow **isolation** at each node
- In case of QoS violation, **penalisation**

Adaptive infrastructure for sensor data analysis

- **Multiple** concurrent data streams with **SLA**
- **Variable** properties: rate and data types; various processing models
- Support for **in-transit** analysis, enforcing **QoS**
- Support for **admission** control & flow **isolation** at each node
- In case of QoS violation, **penalisation**

Key focus

- Understanding **revenue models** for in-transit analysis
- Understanding the impact on **faults** on such a revenue model

Outline

- 1 Background
 - Petri nets
 - Reference nets
- 2 In-transit Analysis
- 3 System Architecture & Revenue Model
 - Token Bucket
 - Autonomic Data Transfer Service
- 4 Evaluation
- 5 Conclusions and Future Work

Universidad
Zaragoza

Outline

- 1 Background
 - Petri nets
 - Reference nets
- 2 In-transit Analysis
- 3 System Architecture & Revenue Model
 - Token Bucket
 - Autonomic Data Transfer Service
- 4 Evaluation
- 5 Conclusions and Future Work

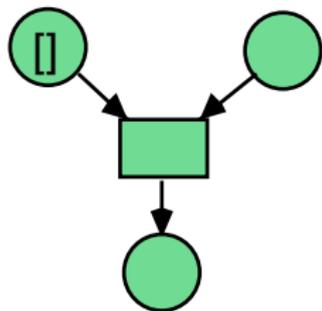

Universidad
Zaragoza

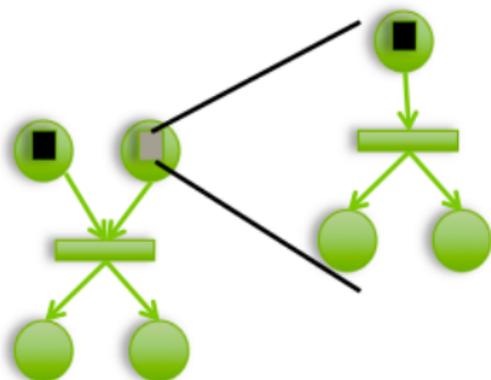

Petri nets

Characteristics

- directed bipartite **graph**
- 2 types of **nodes**: places and transitions
- **arcs**: place-transition, transition-place
- **tokens**: move on the graph
- **static** structural nature

Reference nets

Characteristics

- **tokens** can be nets – dynamic hierarchies of Petri nets
- **Java** inscriptions & **Renew** interpreter
- we can build executable rapid prototype models – concurrency

Outline

- 1 Background
 - Petri nets
 - Reference nets
- 2 In-transit Analysis
- 3 System Architecture & Revenue Model
 - Token Bucket
 - Autonomic Data Transfer Service
- 4 Evaluation
- 5 Conclusions and Future Work

Universidad
Zaragoza

In-transit Analysis

Characteristics

- Perform **partial/full** processing of data from source to destination
- Benefit from availability of **slack** in the network – i.e. availability of excess capacity at processing nodes
- Useful to support: filtering, statistical analysis (min, max, avg) over a window size – i.e. common (often repeated) operations
- Same operation available at **multiple nodes** – location of analysis not important

Universidad
Zaragoza

Outline

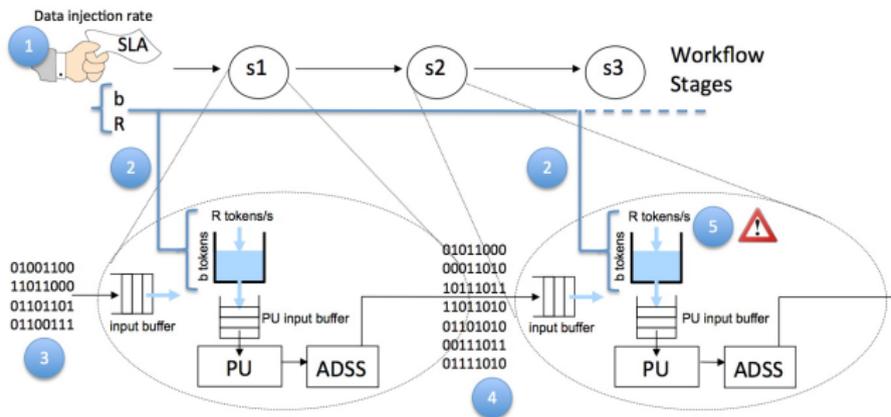

- 1 Background
 - Petri nets
 - Reference nets
- 2 In-transit Analysis
- 3 System Architecture & Revenue Model
 - Token Bucket
 - Autonomic Data Transfer Service
- 4 Evaluation
- 5 Conclusions and Future Work

Universidad
Zaragoza

System Architecture

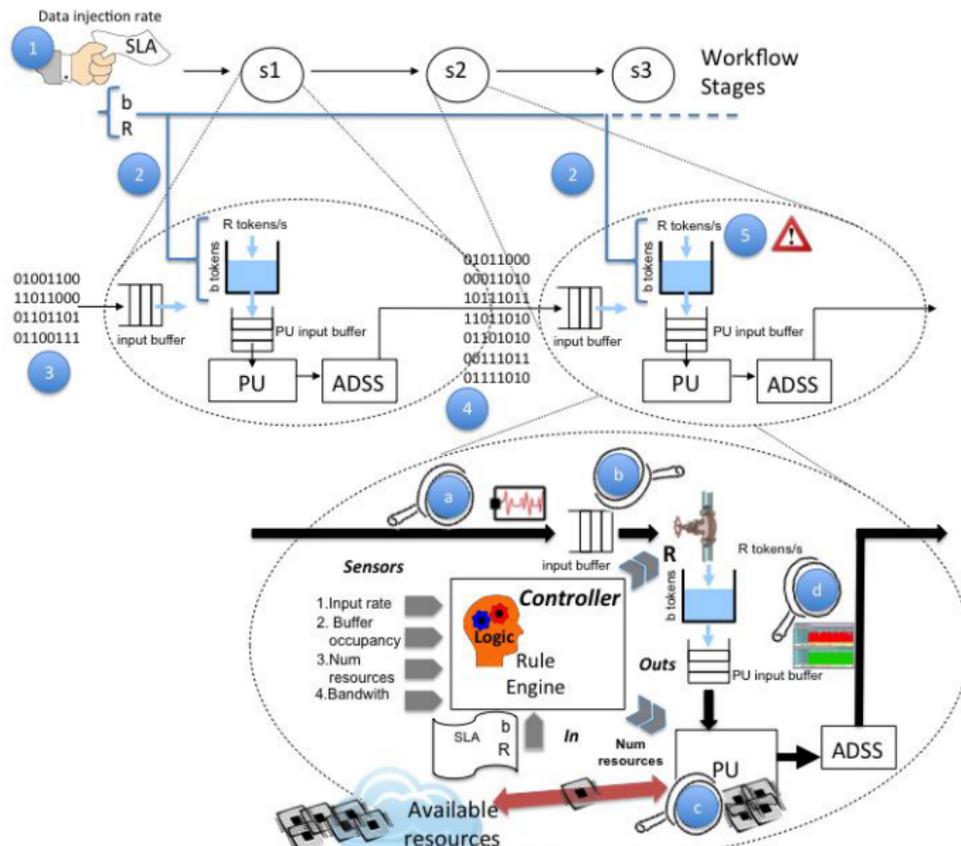

- 3 key components / node: Token Bucket, Processing Unit & output streaming
- Each component provides various **tunable parameters** – these can be externally modified

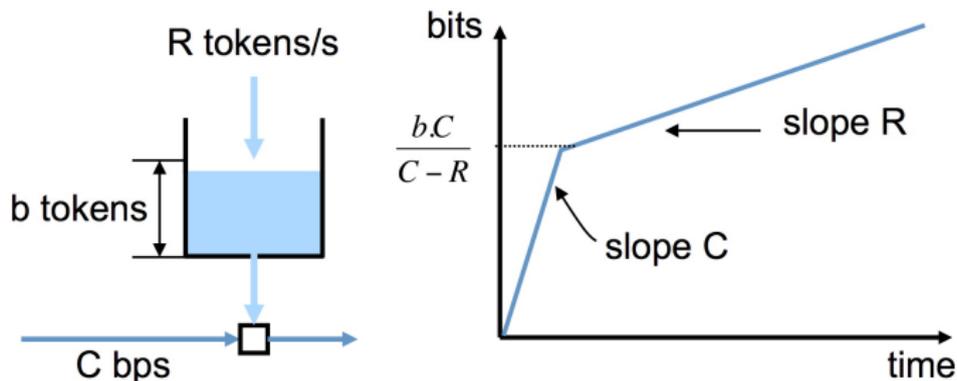

Universidad
Zaragoza

System Architecture

Token Bucket Behaviour

- Two key parameters of interest: R and b .
- Behaviour is dictated by changes in these two parameters.

Revenue Model for a Cloud Provider

Elements of the Model

- **Revenue:** prices charged to clients $\sum_{a=1}^n \sum_{b=1}^m Pr(O_{ab})$
- **Cost:** for performing such operations $\sum_{a=1}^n \sum_{b=1}^m c(O_{ab})$
- **Penalisation** in case of QoS violation for client a : $PSLA_a$

Revenue Model for a Cloud Provider

Elements of the Model

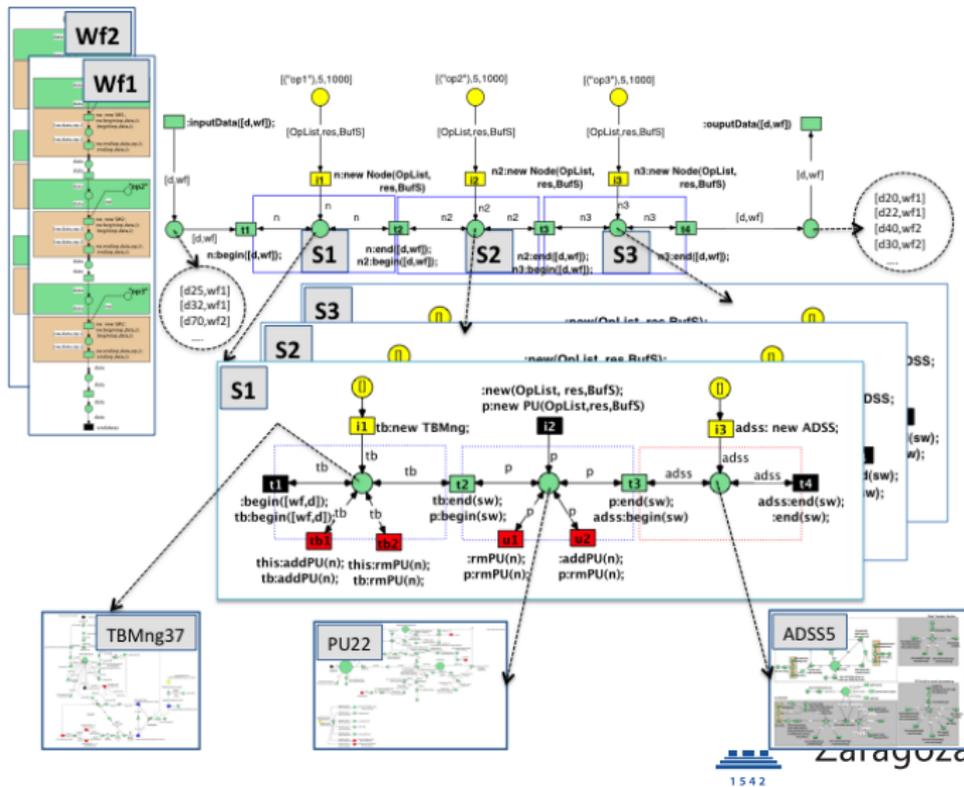

- **Revenue:** prices charged to clients $\sum_{a=1}^n \sum_{b=1}^m Pr(O_{ab})$
- **Cost:** for performing such operations $\sum_{a=1}^n \sum_{b=1}^m c(O_{ab})$
- **Penalisation** in case of QoS violation for client a : $PSLA_a$

Minimizing the cost

- $\sum_{a=1}^n \sum_{b=1}^m Pr(O_{ab}) - \min(\sum_{a=1}^n \sum_{b=1}^m c(O_{ab}), \sum_{a=1}^n PSLA_a)$

Renew Model

Dynamic Resource Provisioning

Conditions

- In the event of failure, **actions**: i) increase of resources, ii) assume penalisation
- In case of failure
 - there is an **increase** in execution time
 - resources are not released as expected – other flows are affected
- The action that minimises cost will be taken

Universidad
Zaragoza

Dynamic Resource Provisioning

Conditions

- In the event of failure, **actions**: i) increase of resources, ii) assume penalisation
- In case of failure
 - there is an **increase** in execution time
 - resources are not released as expected – other flows are affected
- The action that minimises cost will be taken

Model extension

- initial estimated NumRes: $Num\hat{Res}_j = \sum_{i=1}^n R_i / \hat{\delta}_{ij}$
- real-time estimated NumRes: $Num\hat{Res}_j = \sum_{i=1}^n R_i / \delta_{ij}$

Outline

- 1 Background
 - Petri nets
 - Reference nets
- 2 In-transit Analysis
- 3 System Architecture & Revenue Model
 - Token Bucket
 - Autonomic Data Transfer Service
- 4 Evaluation
- 5 Conclusions and Future Work

 - Token Bucket
 - Autonomic Data Transfer Service
- 4 Evaluation
- 5 Conclusions and Future Work

Universidad
Zaragoza

Conclusions and Future Work

Conclusions

- in-transit processing of **multiple** data streams over a **shared** (elastic) infrastructure
- dynamic Token Bucket (admission control): support of **variable bursts**
- **elastic Processing Unit**: add / reduce computational resources
- Autonomic Data Transfer Service: **adaptive** transfers
- Analyse **Revenue** models in the presence of faulty resources
 - two actions: i) add more resources, ii) assume penalisations
 - the action that minimises cost will be taken

Conclusions and Future Work

Conclusions

- in-transit processing of **multiple** data streams over a **shared** (elastic) infrastructure
- dynamic Token Bucket (admission control): support of **variable bursts**
- **elastic Processing Unit**: add / reduce computational resources
- Autonomic Data Transfer Service: **adaptive** transfers
- Analyse **Revenue** models in the presence of faulty resources
 - two actions: i) add more resources, ii) assume penalisations
 - the action that minimises cost will be taken

Future Work

- Currently validating in an Electrical Vehicles scenario
- Considering bursts, variable income data rates
- Trying to minimise the number of resources: Green computing
