

## Part III

«Where are we now?»

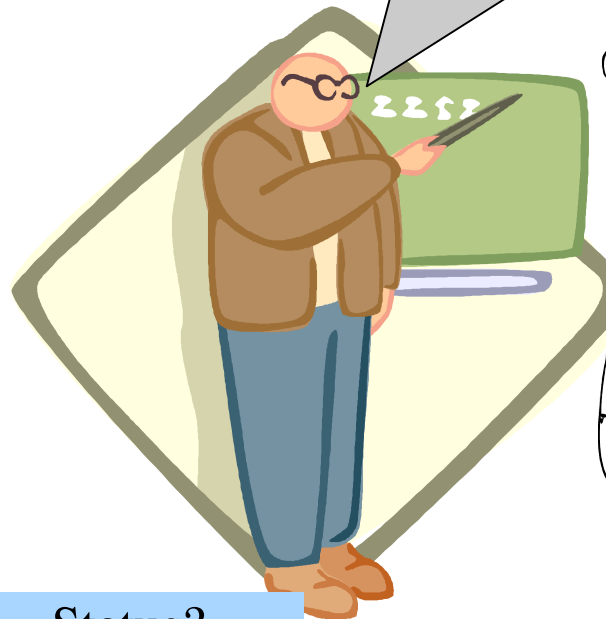

Status and deployment of  
multicast technologies

# Academics vs Users

Multicast has been around for more than a decade, and we've proposed many protocols!

Yes, but very few real applications have been deployed on the Internet!

SRM, DVMRP  
CBT, RMTP,  
LMS, MOSPF,  
MBGP, PIM-DM  
MSDP, IGMP,  
RPM, HBH,  
LBRM,  
DyRAM...

Status?

unicast island

multicast island

inter-domain routing  
tunnelling  
security  
congestion control

incremental deployment  
groups management  
session advertising  
tree construction  
address allocation  
duplication engine  
forwarding state  
routing

Connecting the two world  
is difficult!

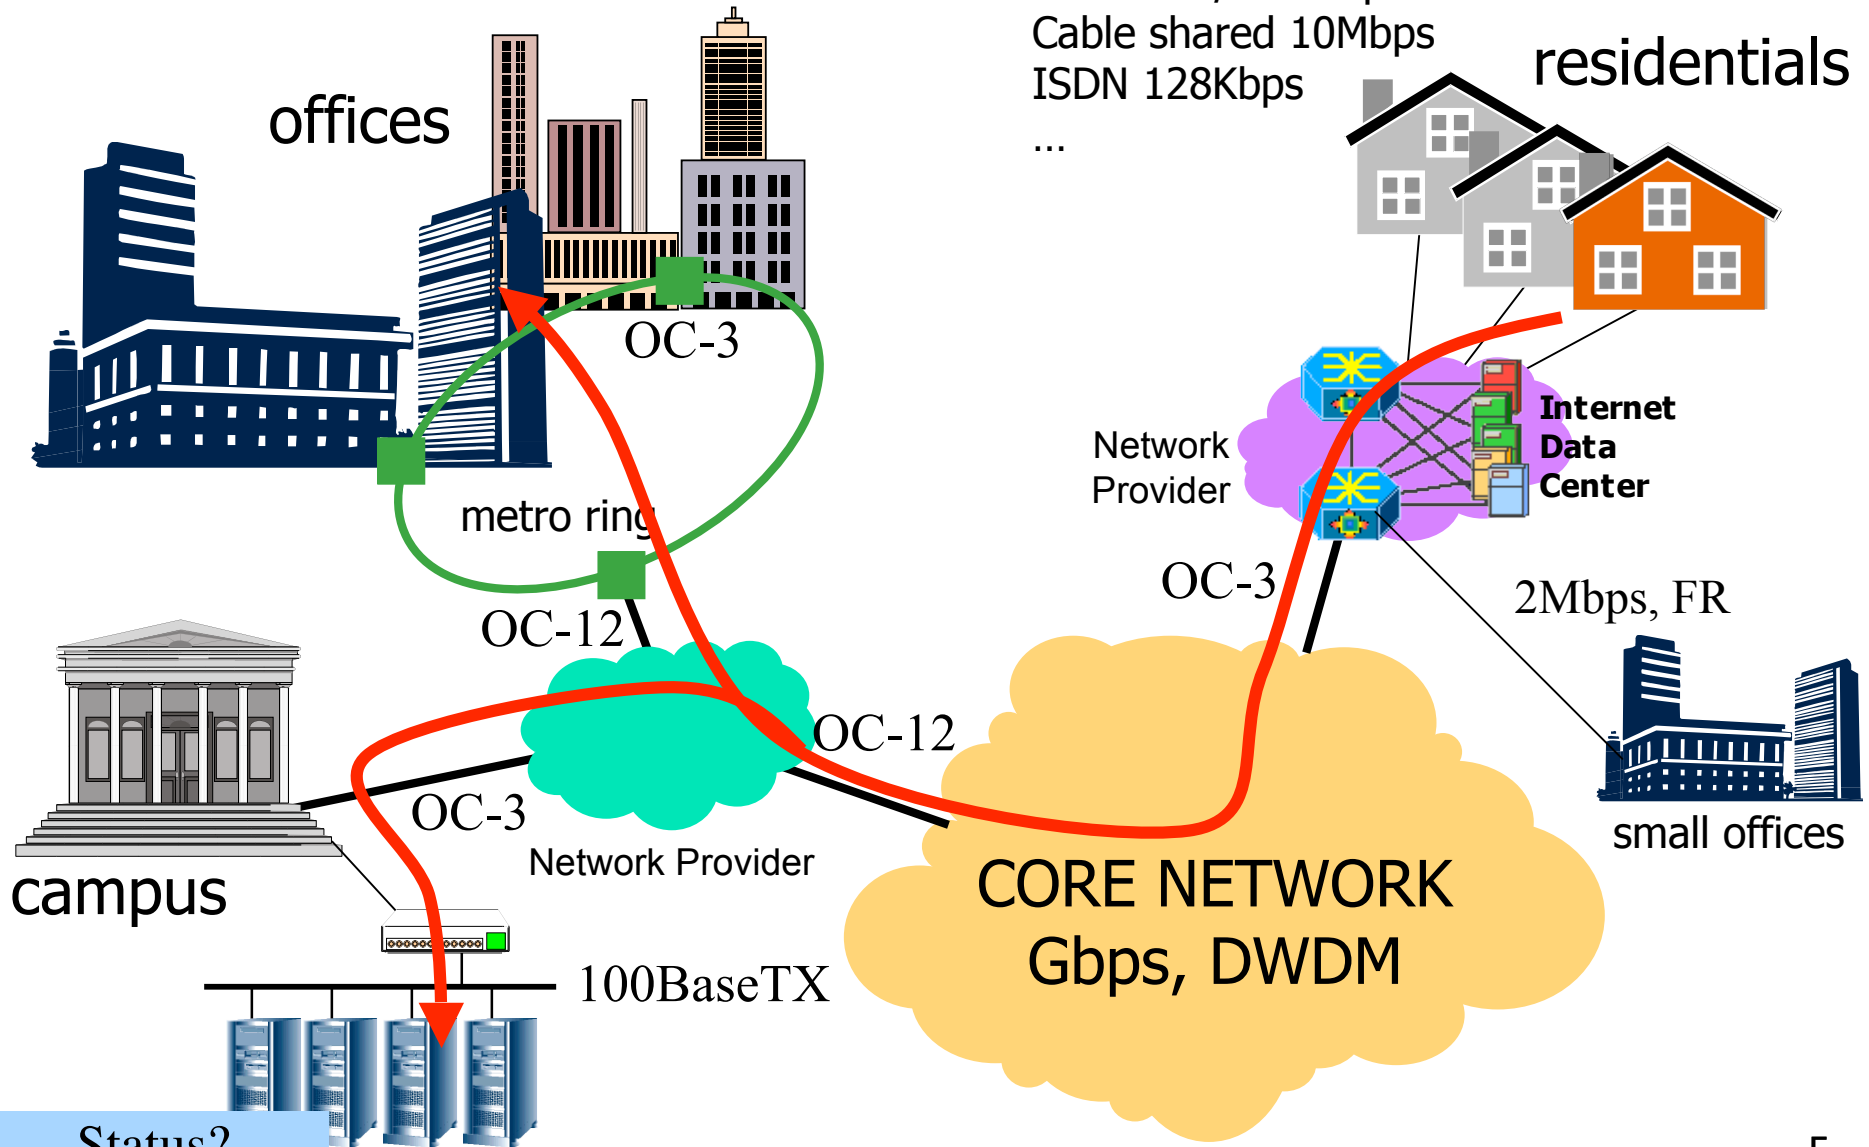

# Inter-domain agreement

Status?

# Users' accesses

- PSTN 56Kbps
- ADSL 128/512 Kbps
- Cable shared 10Mbps
- ISDN 128Kbps
- ...

Status?

# Links heterogeneity

- ❑ Backbone links
  - ❑ optical fibers
  - ❑ 2.5 to 160 Gbps with DWDM techniques
- ❑ End-user access
  - ❑ 9.6Kbps (GSM) to 2Mbps (UMTS) V.90 56Kbps modem on twisted pair
  - ❑ 64Kbps to 1930Kbps ISDN access
  - ❑ 128Kbps to 2Mbps with xDSL modem
  - ❑ 1Mbps to 10Mbps Cable-modem
  - ❑ 155Mbps to 2.5Gbps SONET/SDH

# Internet routers: key elements of internetworking

## □ Routers

- run routing protocols and build routing table,
- receive data packets and perform relaying,
- may have to consider Quality of Service constraints for scheduling packets,
- are highly optimized for packet forwarding functions.

# Multicast in Points of Presence

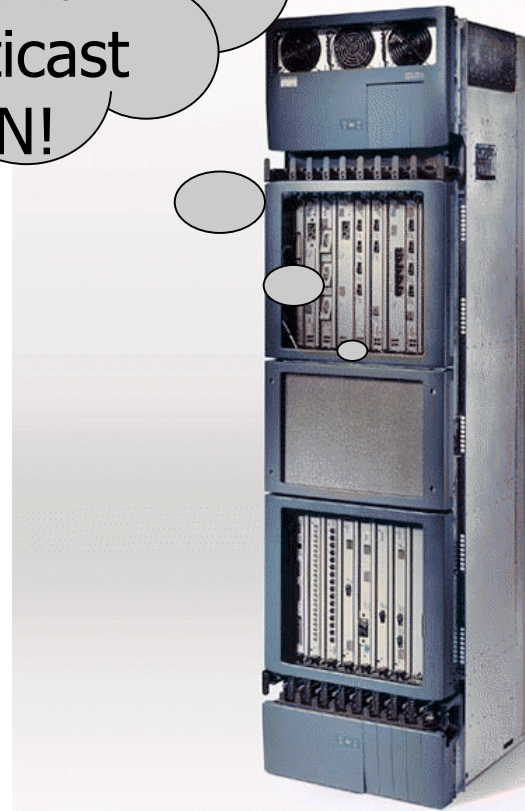

# Multicast, a threat for high-performance routers!

Please!  
Don't turn  
multicast  
ON!

Status?

# The ~~open~~ model no-security

## CONTRACT

Can not control sources

Can not control receivers

Can not control groups

Status?

## Selection of other commercial/prototype products

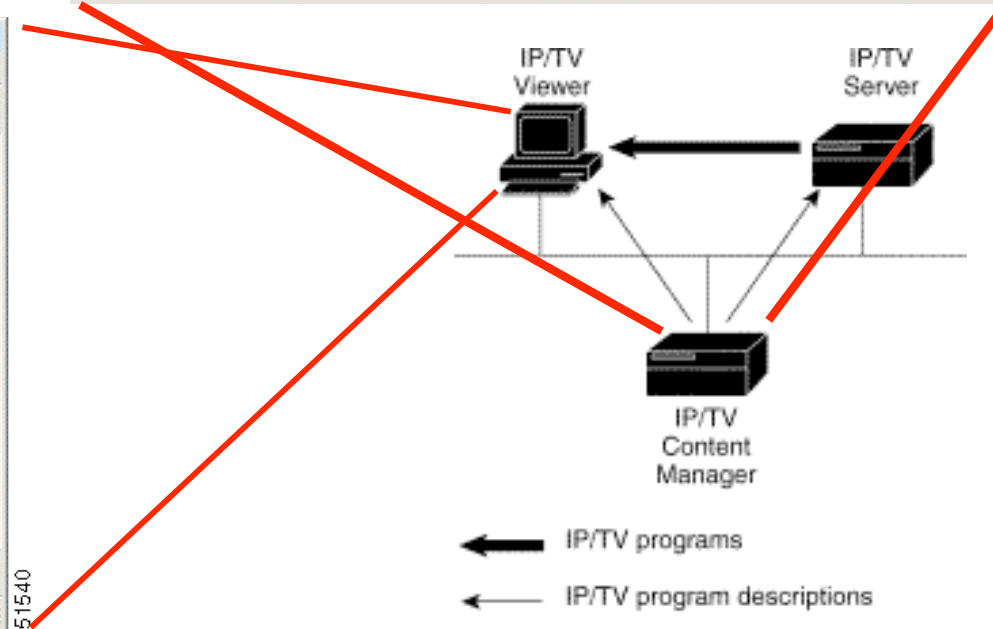

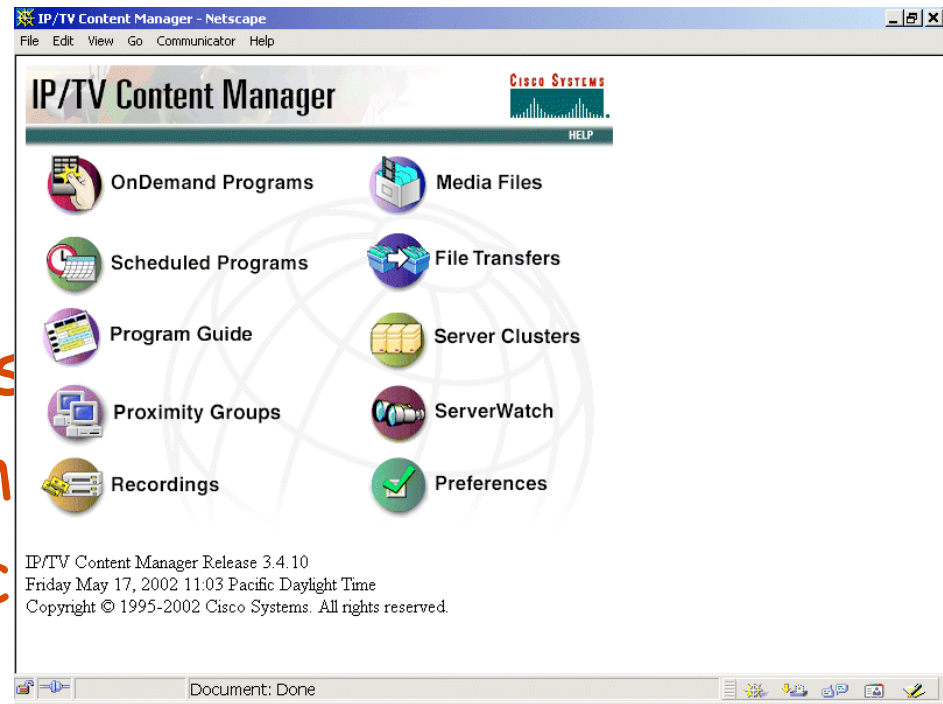

- ❑ CISCO IP/TV, CISCO IP/VC
- ❑ XtremeCast from mPulse
- ❑ Digital Fountain
- ❑ Multicast Monitor
- ❑ much more
  - ❑ RendezVous, Freephone,
  - ❑ MASH, CMT, MultiMon, NTE
  - ❑ MPOLL, MLC, MFTP

# CISCO IP/TV

## Usages

- Training, Business
- Corporate Comm
- Learning, Videoc

Status?

# XtremeCast from mPulse

## □ Usage

- Used by financial firms for stock quotes broadcasting
- Chat server

## □ Reliable multicast implementation with the JRMS library (©SUN)

- <http://www.mpulsetech.com/prod/xcast.htm>

# Digital Fountain products

- ❑ Implement ALC/LCT/WEBRC and rely on two highly efficient large block FEC codecs
  - ❑ <http://www.digitalfountain.com>
  - ❑ high implication in the IETF RMT standardization process

# Multicast Monitor

monitor multicast traffic in the enterprise network

The screenshot displays the Multicast Monitor 3.0.4.200 interface for 'Cache Cluster 1'. It features several key components:

- Statistics Tree:** A hierarchical list on the left showing metrics for 'Total' and two monitored groups. The 'Total' statistics include:
  - Packets In: 1,010,325
  - MB In: 489
  - Last Sample: 1,817
  - Bytes Per Second: 923,597
- Monitored Groups:** Two groups are listed:
  - 239.3.250.1:8000:** Last Sample: 1,719; Packets In: 963,584; MB In: 478; Peak Time: 18:22:05; Peak Packets In: 2,290; Monitoring For: 0 days, 00:00; Samples: 523; Bytes Per Second: 904,555; Peak Bytes Per Second: 1,182,514; Peak Bytes Per Second Time: 18:21:23.
  - 239.3.250.2:8000:** Last Sample: 98; Last Sample Delta: 1; Packets In: 54,741; MB In: 11; Peak Time: 18:27:49; Peak Packets In: 1,713; Monitoring For: 0 days, 00:00; Samples: 523; Bytes Per Second: 19,042; Peak Bytes Per Second: 338,969; Peak Bytes Per Second Time: 18:27:49.
- Throughput Charts:** Two line graphs show 'Packet Throughput' (Packets/PS) and 'Bytes Throughput' (Bytes/PS) over time from 18:24:00 to 18:28:00. The top chart is labeled 'Cache Cluster 1' and the bottom chart is labeled 'Chart Selection Tab'. Both show a red line for group 239.3.250.1:8000 and a green line for group 239.3.250.2:8000.
- Group Selection Tab:** A pie chart showing the distribution of traffic between the two groups:
  - 239.3.250.1:8000: 31.51%
  - 239.3.250.2:8000: 21.08%
  - Other sources: 26.38%, 10.47%, 10.56%
- Top Multicast Sources:** A table listing the top 5 sources with their counts:
 

Source	Packets	Bytes
10.1.2.14	296,564	154,968,901
10.1.2.221	248,256	129,802,122
10.1.2.87	198,451	103,666,121
10.1.4.19	99,419	51,928,411
10.1.4.193	98,543	51,547,294

Status?

# Part IV « The Future »

*Welcome to multicast  
space station*

## BGMP & MASC

IPv6

Multicast and IP-MPLS networks

Multicast and Overlays networks

# Future of inter-domain routing

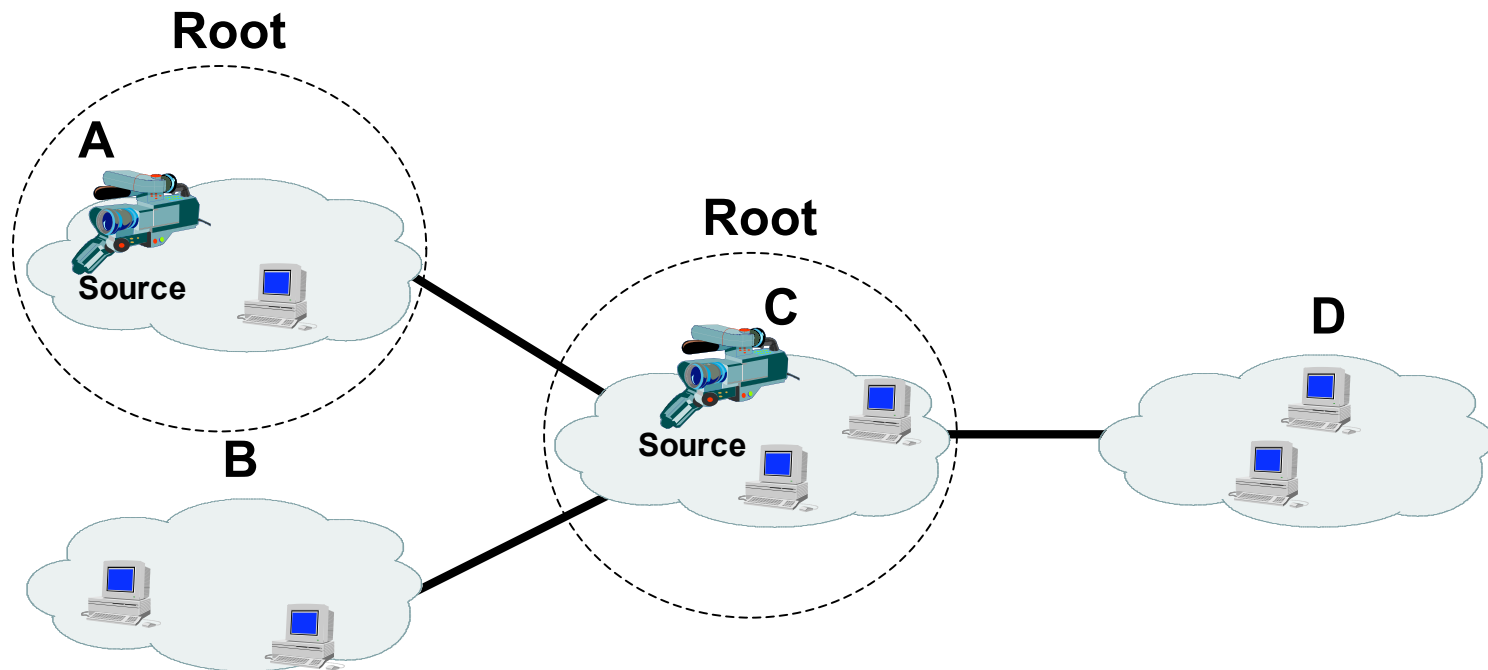

- ❑ PIM-SM/MBGP/MSDP is currently deployed and operational
- ❑ Longer-term solutions are being investigated
- ❑ Border Gateway Multicast Protocol is one of those
  - ❑ Should scale to Internet-size
  - ❑ Generalizes the concept of rendez-vous point

# BGMP

- ❑ Border Gateway Multicast Protocol
  - ❑ Use a PIM-like method between domains
  - ❑ BGMP builds a bidirectional shared tree of domains for a group
  - ❑ A root domain is defined for each multicast group  $G$ 
    - Rendez-vous point mechanism at the domain level
  - ❑ Runs in routers that border a multicast routing domain
  - ❑ Joins and prunes travel accross domains

# How to define the root domain?

- The belief is that no matter the type of session, one domain will always be the logical choice for the root domain

**Need a mechanism for strict multicast address allocation!**

# MASC

- ❑ Multicast Address-Set Claim allocates multicast addresses
  - ❑ At the domain level
  - ❑ Within a domain
  - ❑ Between hosts and the networks
- ❑ Each domain would obtain (from a top-server) a range of multicast addresses that it would manage for lower-level servers (MAAS)

# GLOP, RFC 2770

- ❑ Multicast addresses are assigned based on the AS number
  - ❑ 233/8 address space is used for GLOP
  - ❑ The 16-bit number of the AS number will be concatenated

- ❑ Thus giving 256 multicast addresses per AS

# MASC vs GLOP

- ❑ GLOP is much simpler but...
- ❑ MASC is more scalable!
- ❑ However, more class D addresses could be used for GLOP.
- ❑ GLOP does not specify how multicast addresses will be allocated within a domain
- ❑ MASC is more hierarchical

Part IV  
« The Future »

IPv6

BGMP & MASC

IPv6

Multicast and IP-MPLS networks

Multicast and Overlays networks

# Multicast and IPv6

- ❑ IPv6 multicast addresses (RFC 2373) are distinguished from unicast addresses by the value of the high-order octet of the addresses: a value of 0xFF (binary 11111111) identifies an address as a multicast address
  - ❑ FF02:0:0:0:0:0:0:1 for all Nodes Address
  - ❑ FF02:0:0:0:0:0:0:4 for all DVMRP routers
  - ❑ ...
- ❑ IPv6 adds mobility
- ❑ Multicast for mobile users should be considered

# IPv6 multicast protocol suite

- ❑ Multicast Listener Discovery replaces the IGMP protocol. Current version is MLDv2 (allows SSM, equivalent to IGMPv3)
- ❑ MLD messages are carried in ICMPv6 packets
- ❑ PIM-SM & PIM-SSM remain the same
- ❑ MBGP remains the same, uses address extension to handle seamlessly IPv6 addresses
- ❑ No MSDP for the moment: not scalable enough. Other solutions are investigated

# Part IV

## « The Future »

BGMP & MASC

IPv6

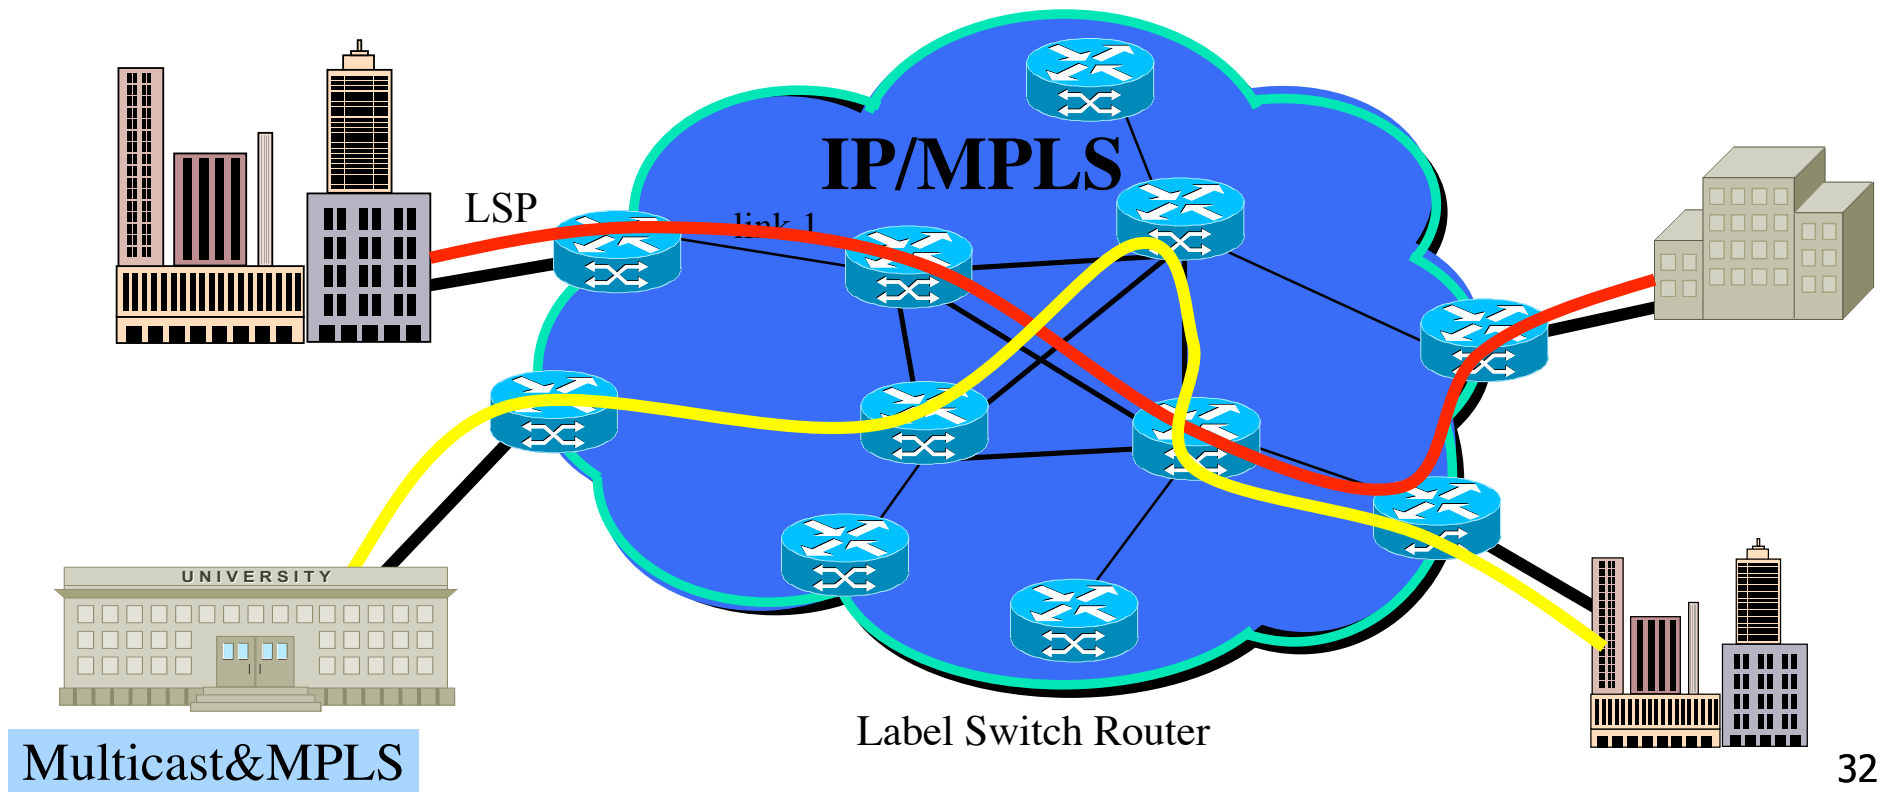

Multicast and IP-MPLS networks

Multicast and Overlays networks

# MPLS

## □ Multi-Protocol Label Switching

- Used to create virtual circuits in IP networks
- Offers traffic engineering features that make it an attractive technology for many telcos and ISPs.

## MPLS is used for...

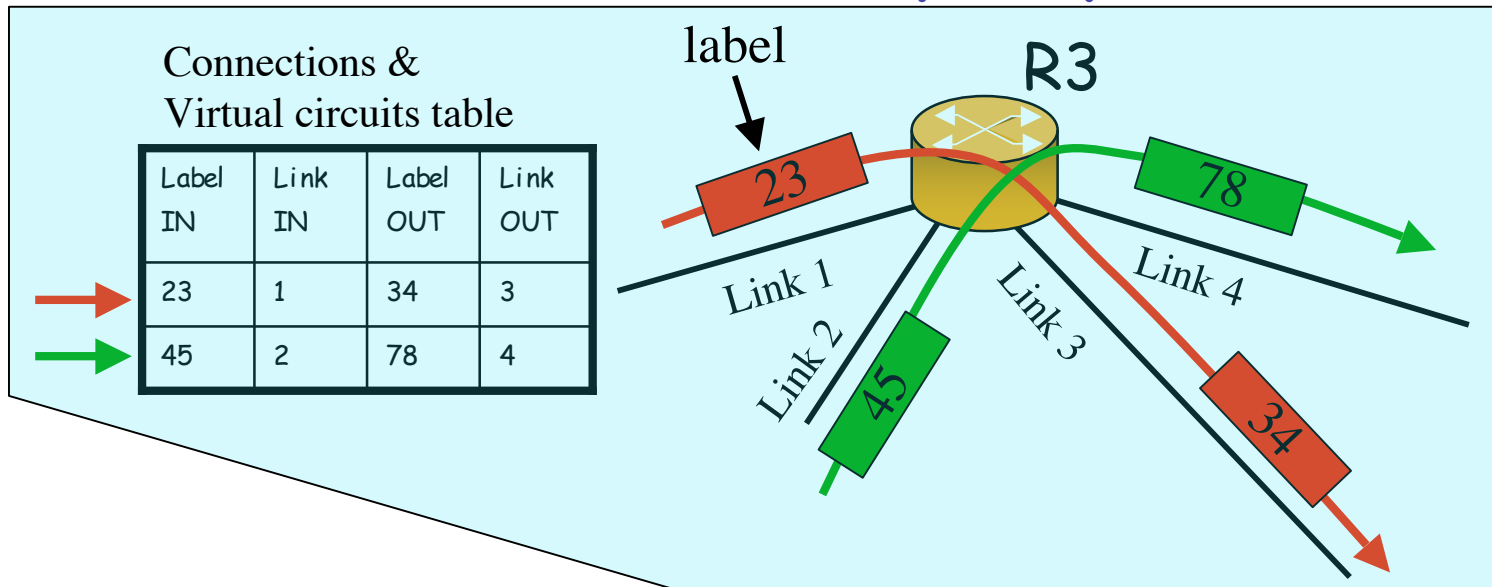

- ❑ Virtual Private Networks (VPN)
- ❑ Dynamic bandwidth provisioning
- ❑ Traffic Engineering
- ❑ Quality of Service
- ❑ Optical networks with (G)MPLS
- ❑ ...

# Multicast on MPLS networks

- ❑ Is a concern because all operators' IP networks may be running MPLS in a very near future
- ❑ MPLS and multicast are in the different layers: L2 for MPLS, L3 for multicast
- ❑ MPLS routers include 2 separate components
  - ❑ **Control**
    - use standard router protocols in L3 to exchange information with other routers to build and maintain a forwarding table
  - ❑ **Forwarding**
    - Search the forwarding table to make a routing decision for each packet (based on labels)

# Review of MPLS operation

## Virtual circuit principles

Virtual  
Circuit  
Switching

# Review of MPLS operations (2)

1a. Routing protocols (e.g. OSPF-TE, IS-IS-TE) exchange reachability to destination networks

1b. Label Distribution Protocol (LDP) establishes label mappings to destination network

4. LSR at egress removes label and delivers packet

2. Ingress LSR receives packet and "label"s packets

Source Yi Lin, modified C. Pham

3. LSR forwards packets using label switching

# Multicast on MPLS networks (con't)

- ❑ MPLS sets mainly point-to-point LSP (i.e. a virtual circuit) in the core network
  - ❑ Multicast needs at least point-to-multipoint
- ❑ Existing routing protocols use flood/prune mechanism to build the tree
  - ❑ Flood/prune mechanism is costly to support in a virtual circuit approach
- ❑ Multicast routing protocols usually use Reverse Path Forwarding (RPF) or other incoming interface check to determine if the packet received belongs to a particular multicast group.
  - ❑ In MPLS, multicast tree should be built on a per-interface basis by combining label value and incoming interface.

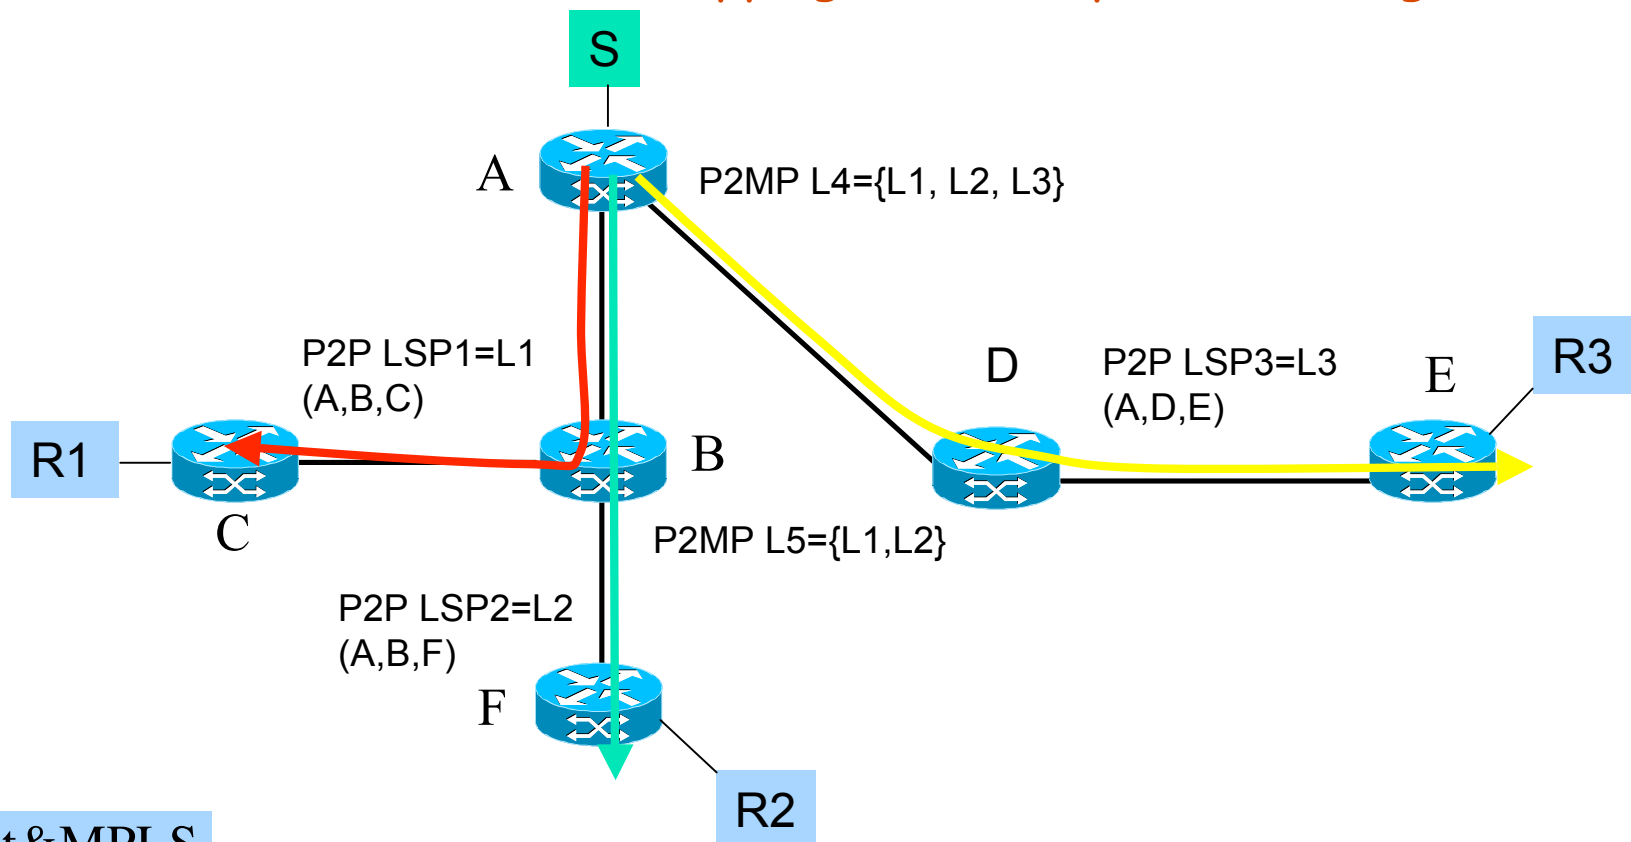

# P2MP LSP (work in progress)

draft-raggarwa-mpls-rsvp-te-p2mp-01.txt

- ❑ The problem is to introduce multicast functionality in the MPLS data plane
  - ❑ Optimize the data plane for high volume multicast
  - ❑ No need to optimize the control plane for multicast
- ❑ P2MP is done in the data plane
- ❑ Control plane uses P2P LSPs as building blocks

# P2MP LSP (con't)

- P2MP LSP is setup by merging individual P2P LSPs (called sub-LSP) in the network
  - Most solutions use merging in the data plane
  - MPLS multicast label mappings are setup at the merge nodes

# Multicast label assignment

- ❑ There are 3 ways to initiate label assignment
  - ❑ topology-driven
  - ❑ request-driven
  - ❑ traffic-driven
- ❑ Topology-driven
  - ❑ When MPLS is used to transmit unicast traffic, Label Switching Path (LSP) is usually triggered by the network topology. In this case LSP already exists before traffic is transmitted.
  - ❑ If topology-driven is applied to multicast, L3 tree needs to be mapped to L2 tree. MPLS-capable routers also have to maintain multicast tree.

# Multicast label assignment (con't)

## ❑ Traffic-driven

- ❑ only sets up LSP to branches with traffic.
- ❑ consumes fewer labels than topology-driven approach. This may take a longer setup time of LSP, but is better for the longer life span multicast group members.

## ❑ Request-driven

- ❑ For explicit multicast members joining/leaving protocols, such as PIM-SM and CBT, join/prune messages can be used to trigger LSP.
- ❑ The drawback is that multicast routing tree has to be constructed twice in L3 and in L2.

## Multicast label assignment (cont.)

- ❑ Label distribution can be achieved by dedicated protocols, e.g. Label Distribution Protocol (LDP) or RSVP-TE, or by piggybacking on routing protocols.
- ❑ Some problems in an MPLS multicast network
  - ❑ mixed forwarding
  - ❑ co-existence of SPT and RPT
    - Setting up a source specific LSP is a solution in PIM-SM.

# Part IV

## « The Future »

IPv6

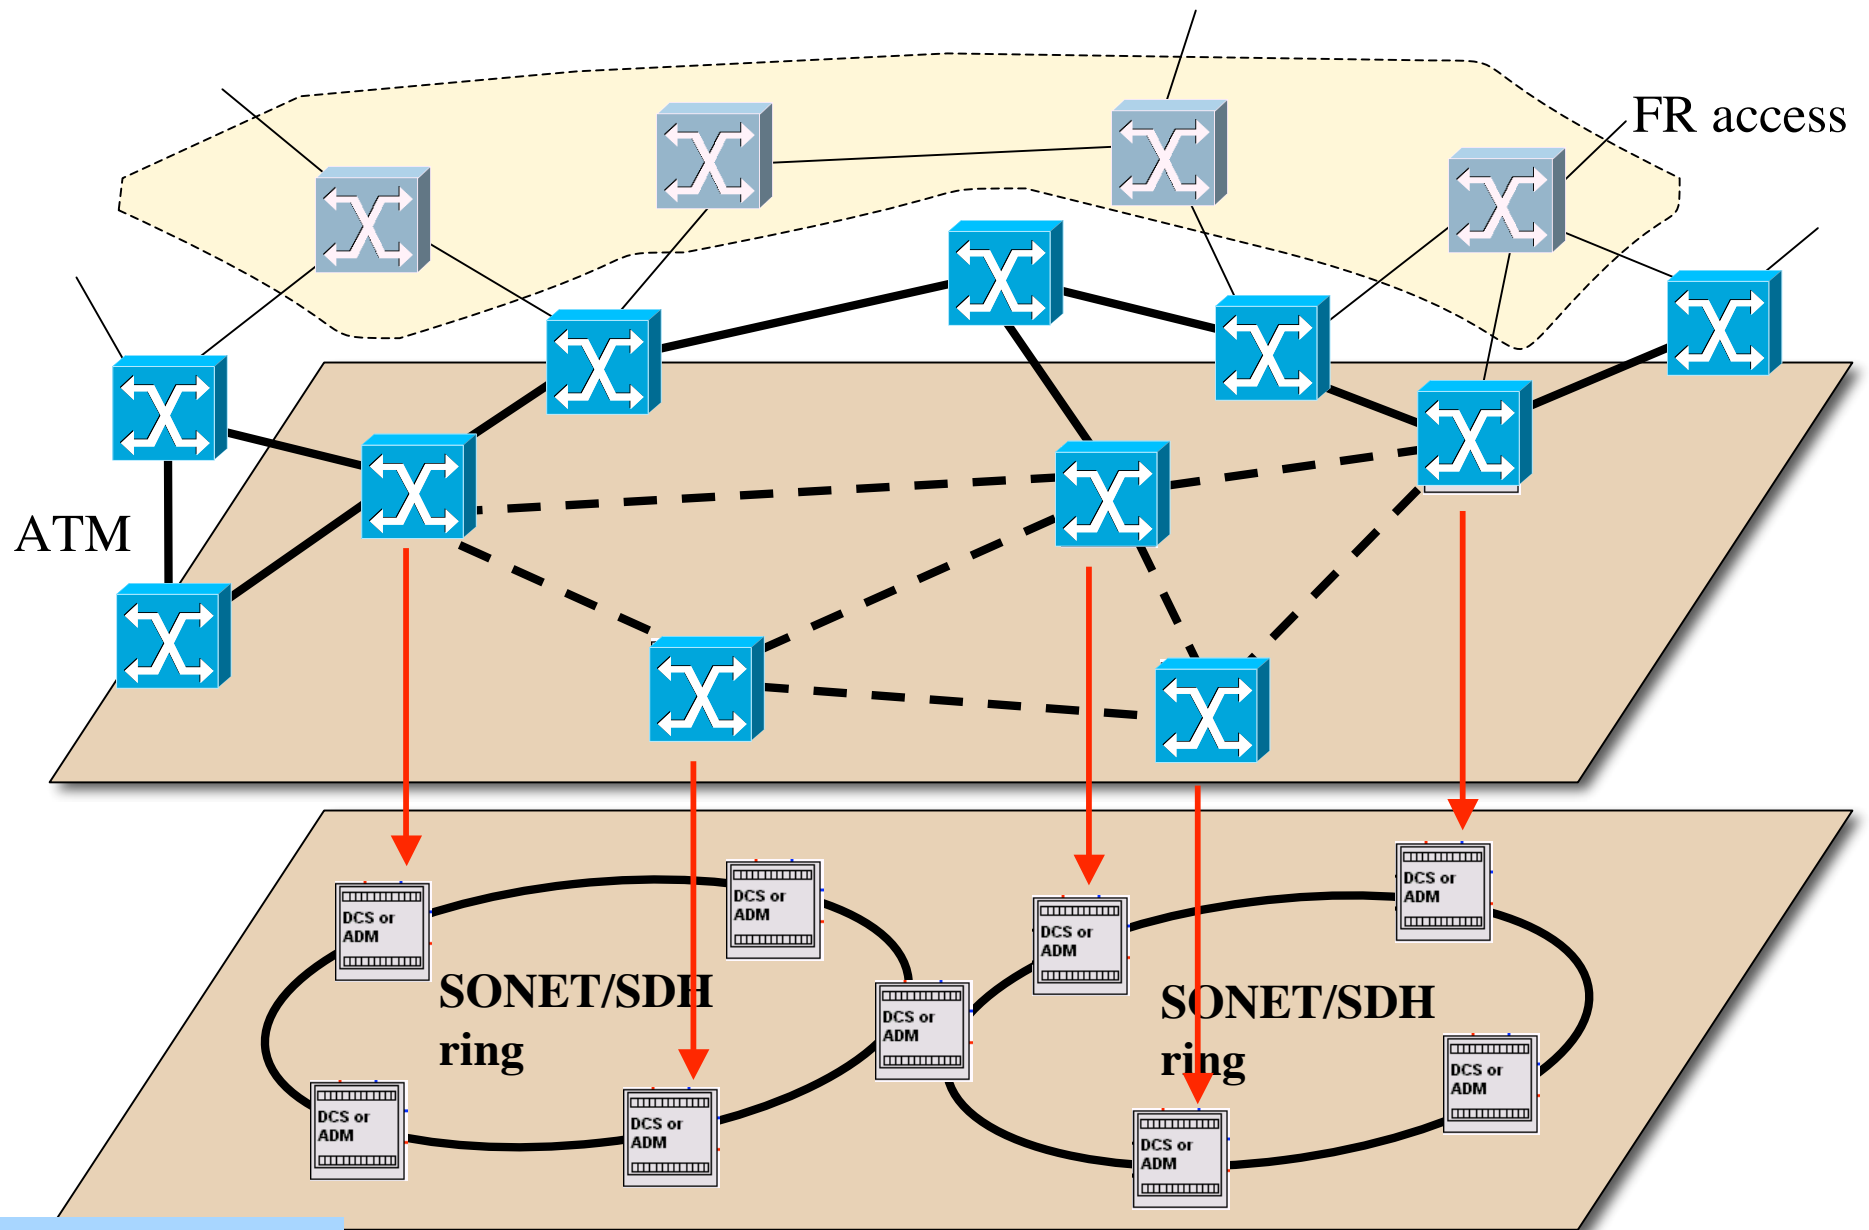

Multicast and IP-MPLS networks

Multicast and Overlays networks

# Overlay networks

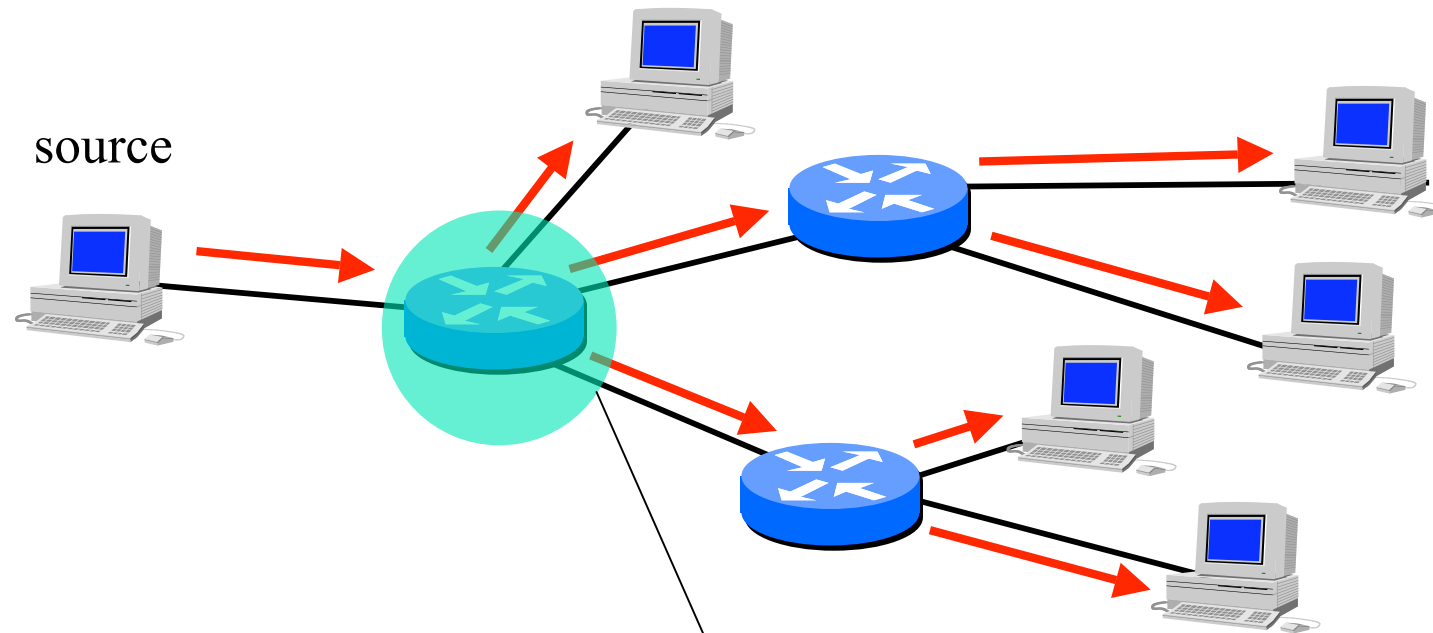

- ❑ An overlay network
  - ❑ is a network built on top of one or more existing networks
  - ❑ adds an additional layer of indirection/virtualization
  - ❑ changes properties in one or more areas of underlying network
- ❑ Alternative
  - ❑ change an existing network layer

# Example

Overlays

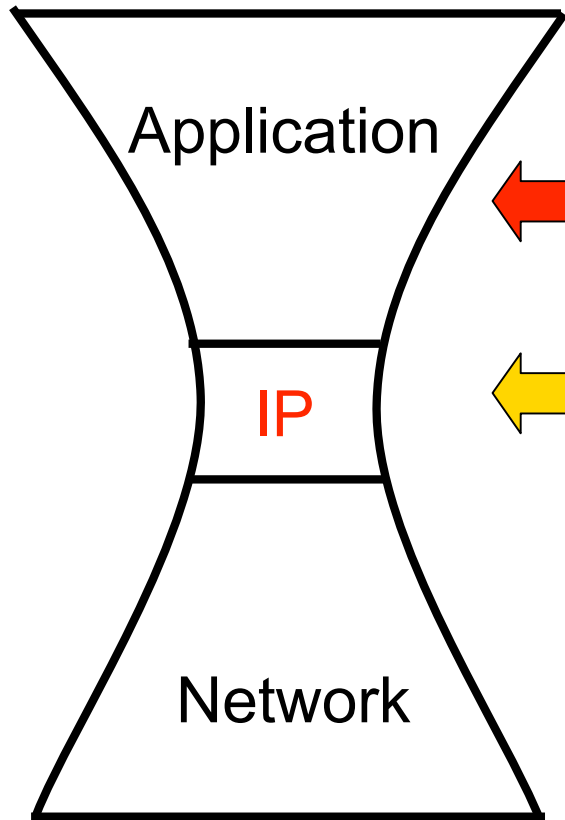

# Review of native IP Multicast

- ❑ Highly efficient
- ❑ Good delay

Additional features in routers are critical to multicast deployment

# At which layer should multicast be implemented?

← **Why not be independent from the network/ISP?**

← Q: Why has IP Multicast not become popular?

A: ISP's reluctant to turn on IP Multicast

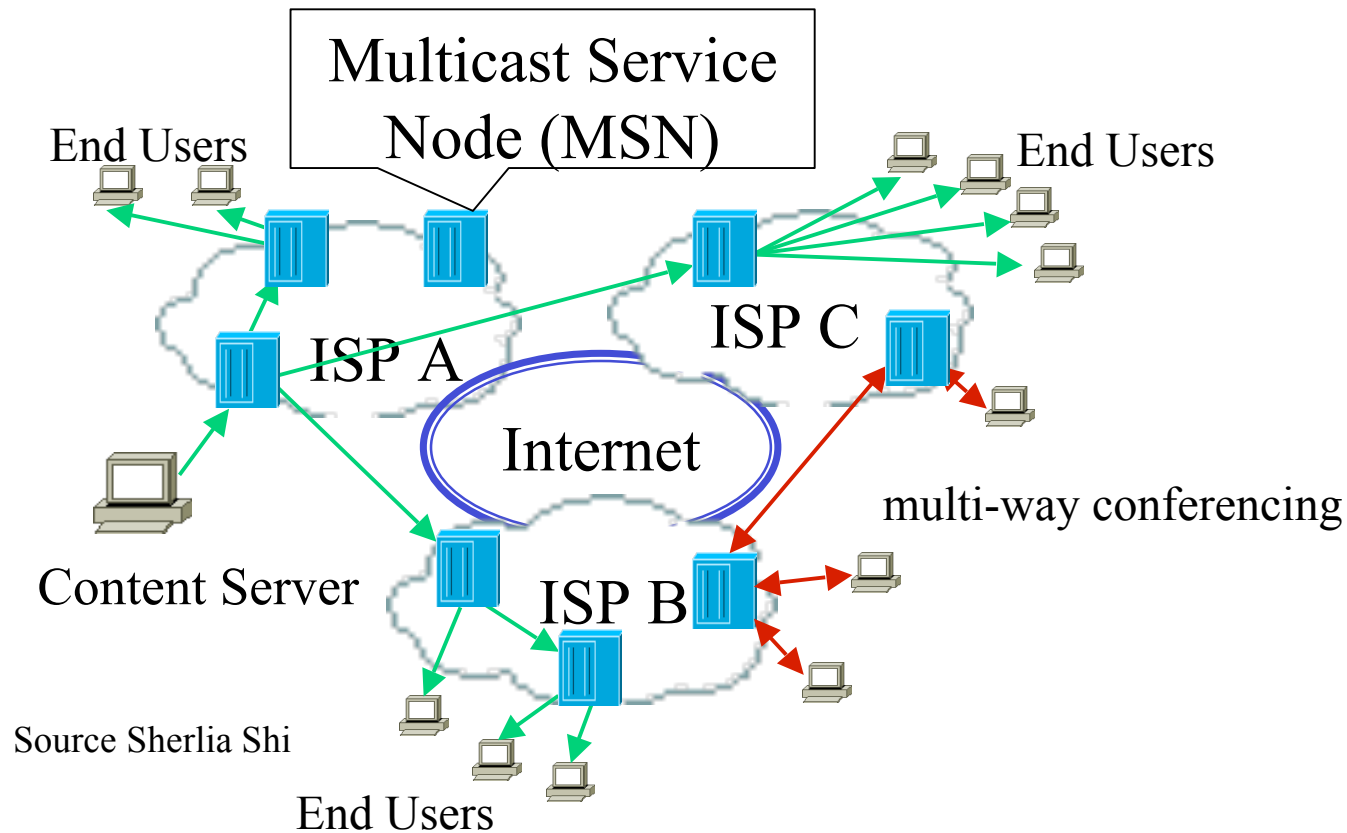

Internet architecture

# Other problems with IP multicast

- ❑ Scales poorly with number of groups
  - ❑ A router must maintain state for every group that traverses it
- ❑ Supporting higher level functionality is difficult
  - ❑ IP Multicast: best-effort multi-point delivery service
  - ❑ Reliability and congestion control for IP Multicast complicated
    - Scalable, end-to-end approach for heterogeneous receivers is very difficult
    - Hop-by-hop approach requires more state and processing in routers

# Overlays for multicast: example

Can go further!

# Similar to peer-to-peer comm.

- Peer-to-peer communication models use end-systems to implement advanced file sharing/system features

- **Naspter**

- **Gnutella**

- **CHORDS**

- **PASTRY**

- ...

Overlay multicast  
End-system multicast  
Host-based multicast  
Application-level/layer multicast

- Multicast on overlays mainly use end-systems to implement multicast-related features: group management, routing, duplication engine...

# End-System Multicast

Overlays

# Pros and cons of end-system multicast

## □ Pros

- Quick deployment
- All multicast state in end systems
- Computation at forwarding points simplifies support for higher level functionality: data packet cache, msg aggregation, congestion control...

## □ Cons

- Higher cost of data replication (bandwidth waste)
- Higher delay: if every body use it on the Internet, what will happen?
- Can not scale to thousands of node (who needs it?)

# Core problem: tree construction

- Well-known optimization problem: can vary width or depth?
  - According to link bandwidth/usage
- However, on the Internet, the tree
  - Must be closely matched to real network topology to be really efficient

# End-system multicast design space

- The tree can be dynamically built with several constraints/heuristics
  - Node's degree
  - Node's utilization
  - Node's geographic position (landmark)
  - Link bandwidth
  - Link delay
  - ...

# End-systems multicast projects

- ❑ NARADA (mesh-first)
- ❑ OVERCAST (tree-first, bandwidth)
- ❑ SCATTERCAST (tree-first, delay)
- ❑ VOID
- ❑ YallCast (tree-first)
- ❑ HMTP (tree-first)
- ❑ OMNI
- ❑ ...

# Conclusions

# Conclusions (1)

- ❑ Multicast: a technology with high potential...
  - ❑ ... but also awfully complex !
- ❑ Technology starts to be mature:
  - ❑ problems are well known and some protocols are already standardized (ALC family)
  - ❑ ACK/NACK protocols are on the way to standardization (takes more time as problems are tougher)
  - ❑ congestion control (and fairness) is a real concern for large scale deployment
  - ❑ does not prevent the use of private reliable multicast solutions

## Conclusions (2)

- ❑ Deployment is mainly driven by academic networks...
  - ❑ where are the killing applications ?
  - ❑ video and popular content distribution to clients...  
yes
  - ❑ high performance computing over datagrids... yes
- ❑ Where should we go?
  - ❑ More specific models (i.e. SSM),
  - ❑ More security, more control
  - ❑ More "individual" initiatives (end-system multicast)?
